

Cancer is invasive enough.

Your treatment needn't be. That's why The Hospital of Central Connecticut is leading the way by offering a new approach for patients with small kidney cancer tumors.

Instead of surgically removing the tumors, doctors freeze the cancerous cells and destroy them, by inserting a special probe that is extremely cold. The outpatient procedure is known as cryoablation. Benefits to patients include quicker recovery, less pain and decreased risk of complications.

It's just another way The Hospital of Central Connecticut is bringing you advanced world-class care, right here in your community.

To learn more about cryoablation for small kidney tumors, please visit our web site, www.thocc.org. For a referral to a doctor who performs this procedure, please call 1-800-321-6244.
