Introduction
About This Assessment

This Community Health Needs Assessment is a systematic, data-driven approach to determining the health status, behaviors and needs of residents in the Hospital of Central Connecticut (HOCC) Service Area. Subsequently, this information may be used to inform decisions and guide efforts to improve community health and wellness.

A Community Health Needs Assessment provides information so that communities may identify issues of greatest concern and decide to commit resources to those areas, thereby making the greatest possible impact on community health status.

This assessment was conducted on behalf of Hartford HealthCare by Professional Research Consultants, Inc. (PRC). PRC is a nationally-recognized healthcare consulting firm with extensive experience conducting Community Health Needs Assessments such as this in hundreds of communities across the United States since 1994.

Methodology

This assessment incorporates data from both quantitative and qualitative sources. Quantitative data input includes primary research (the PRC Community Health Survey) and secondary research (vital statistics and other existing health-related data); these quantitative components allow for comparison to benchmark data at the state and national levels. Qualitative data input includes primary research gathered through an Online Key Informant Survey of various community stakeholders.

PRC Community Health Survey

Survey Instrument

The survey instrument used for this study is based largely on the Centers for Disease Control and Prevention (CDC) Behavioral Risk Factor Surveillance System (BRFSS), as well as various other public health surveys and customized questions addressing gaps in indicator data relative to health promotion and disease prevention objectives and other recognized health issues. The final survey instrument was developed by Hartford HealthCare and PRC.

Community Defined for This Assessment

The study area for the survey effort (referred to as the “Hospital of Central Connecticut Service Area” in this report, or “HOCC”) is defined by 23 residential ZIP Codes segmented into two sub-areas (the Primary Service Area, or PSA, and the Secondary Service Area, or SSA) in Connecticut. This area definition is illustrated in the following map.
Sample Approach & Design

A precise and carefully executed methodology is critical in asserting the validity of the results gathered in the PRC Community Health Survey. Thus, to ensure the best representation of the population surveyed, a telephone interview methodology — one that incorporates both landline and cell phone interviews — was employed. The primary advantages of telephone interviewing are timeliness, efficiency and random-selection capabilities.

The sample design used for this effort consisted of a random sample of 798 individuals age 18 and older in the Hospital of Central Connecticut Service Area. Because this study is part of a larger effort involving multiple regions and hospital service areas, the surveys were distributed among various strata. Once the interviews were completed, these were weighted in proportion to the actual population distribution so as to appropriately represent the Hospital of Central Connecticut Service Area as a whole. All administration of the surveys, data collection and data analysis was conducted by Professional Research Consultants, Inc. (PRC).

For statistical purposes, the maximum rate of error associated with a sample size of 798 respondents is ±3.5% at the 95 percent level of confidence.

Sample Characteristics

To accurately represent the population studied, PRC strives to minimize bias through application of a proven telephone methodology and random-selection techniques. And, while this random sampling of the population produces a highly representative sample, it is a common and preferred practice to “weight” the raw data to improve this representativeness even further. This is accomplished by adjusting the results of a random
sample to match the geographic distribution and demographic characteristics of the population surveyed (poststratification), so as to eliminate any naturally occurring bias.

The following chart outlines the characteristics of the Hospital of Central Connecticut Service Area sample for key demographic variables, compared to actual population characteristics revealed in census data. [Note that the sample consisted solely of area residents age 18 and older; data on children were given by proxy by the person most responsible for that child’s healthcare needs, and these children are not represented demographically in this chart.]

Further note that the poverty descriptions and segmentation used in this report are based on administrative poverty thresholds determined by the US Department of Health & Human Services. These guidelines define poverty status by household income level and number of persons in the household (e.g., the 2014 guidelines place the poverty threshold for a family of four at $23,850 annual household income or lower). In sample segmentation: “low income” refers to community members living in a household with defined poverty status or living just above the poverty level, earning up to twice the poverty threshold; “mid/high income” refers to those households living on incomes which are twice or more the federal poverty level.

The sample design and the quality control procedures used in the data collection ensure that the sample is representative. Thus, the findings may be generalized to the total population of community members in the defined area with a high degree of confidence.

Online Key Informant Survey

To solicit input from key informants, those individuals who have a broad interest in the health of the community, an Online Key Informant Survey was also implemented as part of this process. A list of recommended participants was provided by Hartford HealthCare; this list included names and contact information for physicians, public health representatives, other health professionals, social service providers, and a variety of other community leaders. Potential participants were chosen because of their ability to identify primary concerns of the populations with whom they work, as well as of the community overall.
Key informants were contacted by email, introducing the purpose of the survey and providing a link to take the survey online; reminder emails were sent as needed to increase participation. In all, 47 community stakeholders in the HOCC Service Area took part in the Online Key Informant Survey, as outlined below:

<table>
<thead>
<tr>
<th>Key Informant Type</th>
<th>Number Invited</th>
<th>Number Participating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community/Business Leader</td>
<td>41</td>
<td>11</td>

<td>27</td>
<td>12</td>
</tr>
</tbody>
</table>

Final participation included representatives of the organizations outlined below.

- Capital Community College
- Central Connecticut Health District
- Charter Oak Health Center
- Chrysalis Center, Inc.
- Community Health Services, Inc.
- Connecticut Association of Directors of Health
- Connecticut Children’s Medical Center
- Connecticut Department of Public Health
- Connecticut State Colleges and Universities
- Connecticut State Medical Society
- FaithCare, Inc.
- Farmington Valley Health District
- Hartford Behavioral Health
- Hartford Food System, Inc.
- Hartford Foundation for Public Giving
- Hartford Gay and Lesbian Health Collective
- Hartford Hospital
- Hartford Public Schools
- Hispanic Health Council
- Intercommunity, Inc.
- LCS
- Legal Assistance Resource Center
- Malta House of Care Foundation
- Manchester Community College
- Manchester Health Department
Through this process, input was gathered from several individuals whose organizations work with low-income, minority populations (including African-Americans, American Indians, Asians, Bosnians, Eastern Europeans, ex-offenders, Hispanics, lesbian/gay/bisexual/transgender individuals, low-income residents, Middle Eastern peoples, mixed race individuals, multiple religion families, non-English speaking persons, refugee immigrants, undocumented immigrants, uninsured/underinsured persons, West Indian residents, women), or other medically underserved populations (including those with access and functional needs, African-Americans, Asians, children, deaf/hard of hearing persons, disabled individuals, the elderly, Hispanics, homeless persons, immigrants, lesbian/gays/bisexual/transgender individuals, low-income residents, Medicaid/Medicare recipients, mentally ill persons, Native Americans, non-English speaking persons, people in rural areas, racial/ethnic minorities, single parents, those with substance abuse issues, undocumented immigrants, uninsured/underinsured residents, veterans, young adults).

In the online survey, key informants were asked to rate the degree to which various health issues are a problem in their own community. Follow-up questions asked them to describe why they identify problem areas as such, and how these might be better addressed. Results of their ratings, as well as their verbatim comments, are included throughout this report as they relate to the various other data presented.

NOTE: These findings represent qualitative rather than quantitative data. The Online Key Informant Survey was designed to gather input from participants regarding their opinions and perceptions of the health of the residents in the area. Thus, these findings are based on perceptions, not facts.

Public Health, Vital Statistics & Other Data

A variety of existing (secondary) data sources was consulted to complement the research quality of this Community Health Needs Assessment. Data for the Hospital of Central Connecticut Service Area were obtained from the following sources (specific citations are included with the graphs throughout this report):

- Center for Applied Research and Environmental Systems (CARES)
- Centers for Disease Control & Prevention, Office of Infectious Disease, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention
- Centers for Disease Control & Prevention, Office of Public Health Science Services, Center for Surveillance, Epidemiology and Laboratory Services, Division of Health Informatics and Surveillance (DHIS)
- Centers for Disease Control & Prevention, Office of Public Health Science Services, National Center for Health Statistics
Note that town-specific secondary data were sought and included where available; the remainder of secondary data indicators reflect county-level data for Hartford County.

**Benchmark Data**

**State Risk Factor Data**
Statewide risk factor data are provided where available as an additional benchmark against which to compare local survey findings; these data are reported in the most recent *BRFSS (Behavioral Risk Factor Surveillance System) Prevalence and Trend Data* published by the Centers for Disease Control and Prevention and the US Department of Health & Human Services. State-level vital statistics are also provided for comparison of secondary data indicators.

**Nationwide Risk Factor Data**
Nationwide risk factor data, which are also provided in comparison charts, are taken from the *2013 PRC National Health Survey*; the methodological approach for the national study is identical to that employed in this assessment, and these data may be generalized to the US population with a high degree of confidence. National-level vital statistics are also provided for comparison of secondary data indicators.

**Healthy People 2020**
Healthy People provides science-based, 10-year national objectives for improving the health of all Americans. The Healthy People initiative is grounded in the principle that setting national objectives and monitoring progress can motivate action. For three decades, Healthy People has established benchmarks and monitored progress over time in order to:

- Encourage collaborations across sectors.
- Guide individuals toward making informed health decisions.
- Measure the impact of prevention activities.

Healthy People 2020 is the product of an extensive stakeholder feedback process that is unparalleled in government and health. It integrates input from public health and prevention
experts, a wide range of federal, state and local government officials, a consortium of more than 2,000 organizations, and perhaps most importantly, the public. More than 8,000 comments were considered in drafting a comprehensive set of Healthy People 2020 objectives.

**Determining Significance**

Differences noted in this report represent those determined to be significant. For survey-derived indicators (which are subject to sampling error), statistical significance is determined based on confidence intervals (at the 95 percent confidence level) using question-specific samples and response rates. For secondary data indicators (which do not carry sampling error, but might be subject to reporting error), “significance,” for the purpose of this report, is determined by a 5% variation from the comparative measure.

**Information Gaps**

While this assessment is quite comprehensive, it cannot measure all possible aspects of health in the community, nor can it adequately represent all possible populations of interest. It must be recognized that these information gaps might in some ways limit the ability to assess all of the community’s health needs.

For example, certain population groups — such as the homeless, institutionalized persons, or those who only speak a language other than English or Spanish — are not represented in the survey data. Other population groups — for example, pregnant women, lesbian/gay/bisexual/transgender residents, undocumented residents, and members of certain racial/ethnic or immigrant groups — might not be identifiable or might not be represented in numbers sufficient for independent analyses.

In terms of content, this assessment was designed to provide a comprehensive and broad picture of the health of the overall community. However, there are certainly a great number of medical conditions that are not specifically addressed.
IRS Form 990, Schedule H Compliance

For non-profit hospitals, a Community Health Needs Assessment (CHNA) also serves to satisfy certain requirements of tax reporting, pursuant to provisions of the Patient Protection & Affordable Care Act of 2010. To understand which elements of this report relate to those requested as part of hospitals’ reporting on IRS Form 990 Schedule H, the following table cross-references related sections.

Summary of Findings
Significant Health Needs of the Community

The following “areas of opportunity” represent the significant health needs of the community, based on the information gathered through this Community Health Needs Assessment and the guidelines set forth in Healthy People 2020. From these data, opportunities for health improvement exist in the area with regard to the following health issues (see also the summary tables presented in the following section).

<table>

Prioritization of Health Needs

On June 10, 2015, The Hospital of Central Connecticut hosted a meeting of both internal stakeholders and representatives of community organizations to evaluate, discuss and prioritize health issues for the community, based on findings of the 2015 PRC Community Health Needs Assessment (CHNA). Professional Research Consultants, Inc. (PRC) began the meeting with a presentation of key findings from the CHNA, highlighting the significant health issues identified from the research.

Following the data review, PRC answered any questions and facilitated a group dialogue, allowing participants to advocate for any of the health issues discussed. Subsequently, participants were provided an overview of the prioritization exercise that followed.

In order to assign priority to the identified health needs, a wireless audience response system was used in which each participant was able to register his/her ratings using a small remote keypad. The participants were asked to evaluate each health issue along two criteria:

- **Scope & Severity** — The first rating was to gauge the magnitude of the problem in consideration of the following:
  - How many people are affected?
  - How does the local community data compare to state or national levels, or Healthy People 2020 targets?
  - To what degree does each health issue lead to death or disability, impair quality of life, or impact other health issues?

  Ratings were entered on a scale of 1 (not very prevalent at all, with only minimal health consequences) to 10 (extremely prevalent, with very serious health consequences).

- **Ability to Impact** — A second rating was designed to measure the perceived likelihood of the hospital having a positive impact on each health issue, given available resources, competencies, spheres of influence, etc. Ratings were entered on a scale of 1 (no ability to impact) to 10 (great ability to impact).
Individuals' ratings for each criteria were averaged for each tested health issue, and then these composite criteria scores were averaged to produce an overall score. This process yielded the following prioritized list of community health needs:

1. Nutrition, Physical Activity & Weight
2. Mental Health
3. Heart Disease & Stroke
4. Diabetes
5. Cancer
6. Substance Abuse
7. Respiratory Diseases
8. Infant Health & Family Planning
9. Dementias, Including Alzheimer’s Disease
10. Injury & Violence
11. Sexually Transmitted Diseases
12. Chronic Kidney Disease
13. HIV/AIDS
14. Potentially Disabling Conditions

While the hospital will likely not implement strategies for all of these health issues, the results of this prioritization exercise will be used to inform the development of HOCC’s Implementation Strategy to address the top health needs of the community in the coming years.
Summary Tables: Comparisons With Benchmark Data

The following tables provide an overview of indicators in the Hospital of Central Connecticut Service Area. These data are grouped to correspond with the Focus Areas presented in Healthy People 2020.

Reading the Data Summary Tables

- In the following charts, the Hospital of Central Connecticut Service Area results are shown in the larger, blue column.
- The columns to the right of the service area column provide comparisons between local data and any available state and national findings, and Healthy People 2020 targets. Symbols indicate whether the Hospital of Central Connecticut Service Area compares favorably (☉), unfavorably (☉), or comparably (☉) to these external data.

Note that blank table cells signify that data are not available or are not reliable for that area and/or for that indicator.

Data Charts &
Key Informant Input
Community Characteristics

Population Characteristics
Data from the US Census Bureau reveal the following statistics for our community relative to size, population, density, age, race/ethnicity and language. Keep in mind:

- A significant positive or negative shift in total population over time impacts healthcare providers and the utilization of community resources.
- Urban areas are identified using population density, count, and size thresholds. Urban areas also include territory with a high degree of impervious surface (development). Rural areas are all areas that are not urban.
- It is important to understand the age distribution of the population as different age groups have unique health needs which should be considered separately from others along the age spectrum.

Social Determinants of Health

About Social Determinants

Health starts in our homes, schools, workplaces, neighborhoods, and communities. We know that taking care of ourselves by eating well and staying active, not smoking, getting the recommended immunizations and screening tests, and seeing a doctor when we are sick all influence our health. Our health is also determined in part by access to social and economic opportunities; the resources and supports available in our homes, neighborhoods, and communities; the quality of our schooling; the safety of our workplaces; the cleanliness of our water, food, and air; and the nature of our social interactions and relationships. The conditions in which we live explain in part why some Americans are healthier than others and why Americans more generally are not as healthy as they could be.

Activity Limitations

About Disability & Health

An individual can get a disabling impairment or chronic condition at any point in life. Compared with people without disabilities, people with disabilities are more likely to:

- Experience difficulties or delays in getting the health care they need.
- Not have had an annual dental visit.
- Not have had a mammogram in past 2 years.
- Not have had a Pap test within the past 3 years.
- Not engage in fitness activities.
- Use tobacco.
- Be overweight or obese.
- Have high blood pressure.
- Experience symptoms of psychological distress.
- Receive less social-emotional support.
- Have lower employment rates.

There are many social and physical factors that influence the health of people with disabilities. The following three areas for public health action have been identified, using the International Classification of Functioning, Disability, and Health (ICF) and the three World Health Organization (WHO) principles of action for addressing health determinants.

- Improve the conditions of daily life by: encouraging communities to be accessible so all can live in, move through, and interact with their environment; encouraging community living; and removing barriers in the environment using both physical universal design concepts and operational policy shifts.
- Address the inequitable distribution of resources among people with disabilities and those without disabilities by increasing: appropriate health care for people with disabilities; education and work opportunities; social participation; and access to needed technologies and assistive supports.
- Expand the knowledge base and raise awareness about determinants of health for people with disabilities by increasing: the inclusion of people with disabilities in public health data collection efforts across the lifespan; the inclusion of people with disabilities in health promotion activities; and the expansion of disability and health training opportunities for public health and health care professionals.

Mental Health

About Mental Health & Mental Disorders

Mental health is a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with challenges. Mental health is essential to personal well-being, family and interpersonal relationships, and the ability to contribute to community or society. Mental disorders are health conditions that are characterized by alterations in thinking, mood, and/or behavior that are associated with distress and/or impaired functioning. Mental disorders contribute to a host of problems that may include disability, pain, or death. Mental illness is the term that refers collectively to all diagnosable mental disorders. Mental disorders are among the most common causes of disability. The resulting disease burden of mental illness is among the highest of all diseases.

Mental health and physical health are closely connected. Mental health plays a major role in people’s ability to maintain good physical health. Mental illnesses, such as depression and anxiety, affect people’s ability to participate in health-promoting behaviors. In turn, problems with physical health, such as chronic diseases, can have a serious impact on mental health and decrease a person’s ability to participate in treatment and recovery.

The existing model for understanding mental health and mental disorders emphasizes the interaction of social, environmental, and genetic factors throughout the lifespan. In behavioral health, researchers identify: risk factors, which predispose individuals to mental illness; and protective factors, which protect them from developing mental disorders. Researchers now know that the prevention of mental, emotional, and behavioral (MEB) disorders is inherently interdisciplinary and draws on a variety of different strategies. Over the past 20 years, research on the prevention of mental disorders has progressed. The major areas of progress include evidence that:

- MEB disorders are common and begin early in life.
- The greatest opportunity for prevention is among young people.
- There are multyear effects of multiple preventive interventions on reducing substance abuse, conduct disorder, antisocial behavior, aggression, and child maltreatment.
- The incidence of depression among pregnant women and adolescents can be reduced.
- School-based violence prevention can reduce the base rate of aggressive problems in an average school by 25 to 33%.
- There are potential indicated preventive interventions for schizophrenia.
- Improving family functioning and positive parenting can have positive outcomes on mental health and can reduce poverty-related risk.
- School-based preventive interventions aimed at improving social and emotional outcomes can also improve academic outcomes.
- Interventions targeting families dealing with adversities, such as parental depression or divorce, can be effective in reducing risk for depression in children and increasing effective parenting.
- Some preventive interventions have benefits that exceed costs, with the available evidence strongest for early childhood interventions.
- Implementation is complex, it is important that interventions be relevant to the target audiences.
- In addition to advancements in the prevention of mental disorders, there continues to be steady progress in treating mental disorders as new drugs and stronger evidence-based outcomes become available.

Self-Reported Mental Health Status

Notes: Asked of all respondents.

Challenges

Among those rating this issue as a “major problem,” the following represent what key informants see as the main challenges for persons with mental illness:

Access to Care

*Access to care. Continued long term follow up and transitions of care with chronic disease and mental illness. Limited providers equipped to meet the needs of those with mental illness. Varied approaches to screening for mental illness, including depression, anxiety and their co-existence in chronic disease.* – Health Provider (Non-Physician)

*Accessing affordable services. Accessing mental health providers who understand the needs of lesbian, gay, bisexual and transgender individuals.* – Social Services Representative

*Access. When it comes to treatment of mental health, we look at the problem as if it was a short-term one. Insurance plans may cover four outpatient visits, use of medications as a quick fix, not allowing for mid or long term follow-up. Children and Youth have limited access to inpatient services, residential services, etc. Problems encountered in schools are not often dealt with properly due to limited resources.* – Health Provider (Non-Physician)

*Identification and access.* – Community/Business Leader

*Access to timely quality care and substance abuse treatment resources.* – Social Services Representative

*People with commercial or private insurance often have difficulty accessing participating providers or those who participate have limited capacity. Also, despite parity, benefits are often limited.* – Health Provider (Non-Physician)

Lack of Services

*There is limited community resources.* – Health Provider (Non-Physician)

*Mental Health Services is a much needed service in my community. The waiting list is long in some areas and people are having a multitude if mental health issues that are not being addressed on time.* – Social Services Representative

*Inadequate resources, housing is often a challenge. Family education and support.* –
Community/Business Leader

Lack of access to care, especially pediatric services and what is then covered tied to this care. Day programs are almost always uncovered and almost always the most needed for children. – Physician

In addition to the stigma that is still associated with mental health and addiction issues, there are insufficient services and funding for services to meet the need, especially for children and adolescents. – Community/Business Leader

Stigma

Stigma, lack of resources. – Health Provider (Non-Physician)

Stigma. Lack of access to therapy and medical treatment. Cultural barriers to seeking mental help. Criminalizing the mentally ill. – Public Health Expert

Residential Homes

Approximately 60 State of CT managed Group Home, like residential homes are located in Manchester. Some serve individuals released from Prison for transition through a probation period. Other homes are identified for troubled youth, substance abuse, and a wide variety of behavioral health issues. Access to mental health care is provided to a large extent through services located in Manchester. However, there is a tipping point with the number of individuals being moved to reside in Manchester and the capacity to serve them in the medical community. – Public Health Expert

Access to residential and primary care specialists. – Community/Business Leader

Co-Occurrence With Other Issues

Suicide, depression, alcohol and other substance abuse. – Physician

Many patients have social issues as well as BH issues along with their treating medical chronic condition. Many have substance abuse contributing to their need for BH services. Many are uninsured. – Health Provider (Non-Physician)

At-Risk Populations

Stress and depression are major and disproportionate mental health problems among Latinos, among others. Lack of bilingual mental health professionals is major deficit in the service system. – Social Services Representative

We are seeing increasing numbers of students with mental health and behavioral issues. – Community/Business Leader

Studies/Assessment Findings

Studies/assessments have determined that to be the case. – Community/Business Leader

Case Management and Employment

Access to case management and employment. – Social Services Representative

Significantly Under Detected

If people are not well mentally they will develop other issues and will potentially hurt others if not treated. – Health Provider (Non-Physician)
Death, Disease & Chronic Conditions

Leading Causes of Death

Distribution of Deaths by Cause
Cancers and cardiovascular disease (heart disease and stroke) are leading causes of death in the community.

Leading Causes of Death
(Hartford County, 2011-2013)

- Heart Disease 23.8%
- Cancer 21.8%
- Stroke 4.3%
- Unintentional Injuries 5.4%
- CLRD 4.0%
- Other 40.7%

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted February 2015.
Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- CLRD is chronic lower respiratory disease.
Age-Adjusted Death Rates for Selected Causes

In order to compare mortality in the region with other localities (in this case, the state and the United States), it is necessary to look at rates of death — these are figures which represent the number of deaths in relation to the population size (such as deaths per 100,000 population, as is used here).

Furthermore, in order to compare localities without undue bias toward younger or older populations, the common convention is to adjust the data to some common baseline age distribution. Use of these "age-adjusted" rates provides the most valuable means of gauging mortality against benchmark data, as well as Healthy People 2020 targets.

The following chart outlines annual average age-adjusted death rates per 100,000 population for selected causes of death in the area. (For infant mortality data, see Birth Outcomes & Risks in the Births section of this report.)

**Age-Adjusted Death Rates for Selected Causes**

Note:  
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population and coded using ICD-10 codes.
- *The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart; the Diabetes target is adjusted to reflect only diabetes mellitus-coded deaths.
- Local, state and national data are simple three-year averages.
Cardiovascular Disease

About Heart Disease & Stroke

Heart disease is the leading cause of death in the United States, with stroke following as the third leading cause. Together, heart disease and stroke are among the most widespread and costly health problems facing the nation today, accounting for more than $500 billion in healthcare expenditures and related expenses in 2010 alone. Fortunately, they are also among the most preventable.

The leading modifiable (controllable) risk factors for heart disease and stroke are:

- High blood pressure
- High cholesterol
- Cigarette smoking
- Diabetes
- Poor diet and physical inactivity
- Overweight and obesity

The risk of Americans developing and dying from cardiovascular disease would be substantially reduced if major improvements were made across the US population in diet and physical activity, control of high blood pressure and cholesterol, smoking cessation, and appropriate aspirin use.

The burden of cardiovascular disease is disproportionately distributed across the population. There are significant disparities in the following based on gender, age, race/ethnicity, geographic area, and socioeconomic status:

- Prevalence of risk factors
- Access to treatment
- Appropriate and timely treatment
- Treatment outcomes
- Mortality

Disease does not occur in isolation, and cardiovascular disease is no exception. Cardiovascular health is significantly influenced by the physical, social, and political environment, including: maternal and child health; access to educational opportunities; availability of healthy foods, physical education, and extracurricular activities in schools; opportunities for physical activity, including access to safe and walkable communities; access to healthy foods; quality of working conditions and worksite health; availability of community support and resources; and access to affordable, quality healthcare.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Heart Disease & Stroke Deaths

The greatest share of cardiovascular deaths is attributed to heart disease.
The following charts show available local death rates (age-adjusted) for select towns in the Hospital of Central Connecticut Service Area.

Notes: Asked of all respondents.
Heart disease includes diagnoses of heart attack, angina or coronary heart disease.
Cardiovascular Risk Factors

About Cardiovascular Risk

Controlling risk factors for heart disease and stroke remains a challenge. High blood pressure and cholesterol are still major contributors to the national epidemic of cardiovascular disease. High blood pressure affects approximately 1 in 3 adults in the United States, and more than half of Americans with high blood pressure do not have it under control. High sodium intake is a known risk factor for high blood pressure and heart disease, yet about 90% of American adults exceed their recommendation for sodium intake.

- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 199% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

---

**About Cardiovascular Risk**

Individual level risk factors which put people at increased risk for cardiovascular diseases include:

- High Blood Pressure
- High Blood Cholesterol
- Tobacco Use
- Physical Inactivity
- Poor Nutrition
- Overweight/Obesity
- Diabetes

- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Three health-related behaviors contribute markedly to cardiovascular disease:

**Poor nutrition.** People who are overweight have a higher risk for cardiovascular disease. Almost 60% of adults are overweight or obese. To maintain a proper body weight, experts recommend a well-balanced diet which is low in fat and high in fiber, accompanied by regular exercise.

**Lack of physical activity.** People who are not physically active have twice the risk for heart disease of those who are active. More than half of adults do not achieve recommended levels of physical activity.

**Tobacco use.** Smokers have twice the risk for heart attack of nonsmokers. Nearly one-fifth of all deaths from cardiovascular disease, or about 190,000 deaths a year nationally, are smoking-related. Every day, more than 3,000 young people become daily smokers in the US.

Modifying these behaviors is critical both for preventing and for controlling cardiovascular disease. Other steps that adults who have cardiovascular disease should take to reduce their risk of death and disability include adhering to treatment for high blood pressure and cholesterol, using aspirin as appropriate, and learning the symptoms of heart attack and stroke.

- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

---
**Total Cardiovascular Risk**

The following chart reflects the percentage of adults in the Total Service area who report one or more of the following: being overweight; smoking cigarettes; being physically inactive; or having high blood pressure or cholesterol. See also Nutrition, Physical Activity & Weight and Tobacco Use in the Modifiable Health Risk section of this report.

![Total Cardiovascular Risk Chart]

**Key Informant Input: Heart Disease & Stroke**

The following chart outlines key informants’ perceptions of the severity of Heart Disease & Stroke as a problem in the community:

![Key Informant Input Chart]
Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Leading Cause of Death, Prevalence

Continues to be in the top five houses of death in our city. – Public Health Expert

Data show. – Physician

Can lead to death and other life-threatening and expensive to treat illnesses. – Health Provider (Non-Physician)

Heart disease is the leading cause of death among minorities in the United States, according to the U.S. Department of Health and Human Services Office of Minority Health. Blacks and Hispanics are more likely to suffer from obesity and hypertension, two of the major risk factors for heart disease. – Health Provider (Non-Physician)

Lead cause of death. – Public Health Expert

Studies/assessments have determined that to be the case. – Community/Business Leader

Nutrition, Physical Activity & Weight

Bad habits of today, that offer immediate gratification, leads to these health risks down the road. Stress, poor diets, lack of exercise (no time) are all becoming more a part of our lives. Primary Care can address some challenges when people have coverage and can make their co-payments, but our society has become more "give me what I want now, I’ll deal with the consequences later.” While school meals seem to be improving for our children, the pressure to improve testing scores has led to the elimination of recess and cut down on physical education/activity in many school systems, another example of what we deem to be our priority. – Health Provider (Non-Physician)

Poor diet and exercise. Lack of education. Poor parks and recreation options. Poor urban planning, community infrastructure, barrier to physical activity. Food, desserts. – Public Health Expert

There is a high prevalence of obesity in Hartford which is linked to heart disease. Further there are a number of barriers to accessing nutritious food which make it difficult for families to eat regular balanced nutritious meals. – Community/Business Leader

High-stress lifestyles, lack of exercise, lack of access to and affordability of healthy foods, heavy smoking and consuming alcoholic beverages in excess. – Social Services Representative

Poverty, inadequate diets, not taking the problem serious. – Social Services Representative

At-Risk Populations

African Americans and Hispanics which make up a large percentage of the Hartford population are often affected by heart disease and stroke. Reasons being due to genetics, but largely because of a poor unbalanced diet which contains a vast amount carbohydrates, fats and sodium and not enough grains, fruits and vegetables. – Health Provider (Non-Physician)

With the high rates of diabetes in the city, the risk for heart disease and stroke is also elevated. – Community/Business Leader

Heart disease and stroke in the community are usual as result of another chronic disease not being managed. – Social Services Representative

Individuals who cannot afford care often go untreated with progression of disease states. Limited ability to refer patients to cardiology related to uninsured status. – Health Provider (Non-Physician)
Cancer

About Cancer

Continued advances in cancer research, detection, and treatment have resulted in a decline in both incidence and death rates for all cancers. Among people who develop cancer, more than half will be alive in five years. Yet, cancer remains a leading cause of death in the United States, second only to heart disease.

Many cancers are preventable by reducing risk factors such as: use of tobacco products; physical inactivity and poor nutrition; obesity; and ultraviolet light exposure. Other cancers can be prevented by getting vaccinated against human papillomavirus and hepatitis B virus. In the past decade, overweight and obesity have emerged as new risk factors for developing certain cancers, including colorectal, breast, uterine corpus (endometrial), and kidney cancers. The impact of the current weight trends on cancer incidence will not be fully known for several decades. Continued focus on preventing weight gain will lead to lower rates of cancer and many chronic diseases.

Screening is effective in identifying some types of cancers (see US Preventive Services Task Force [USPSTF] recommendations), including:

- Breast cancer (using mammography)
- Cervical cancer (using Pap tests)
- Colorectal cancer (using fecal occult blood testing, sigmoidoscopy, or colonoscopy)
- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Cancer Deaths

The following chart illustrates age-adjusted mortality in select towns in the Hospital of Central Connecticut Service Area.

Cancer: Age-Adjusted Mortality
(By Select Towns in the HOCC Service Area, 2006-2010)

Source: Connecticut Department of Public Health
Lung cancer is by far the leading cause of cancer deaths in the area. Other leading sites include prostate cancer among men, breast cancer among women, and colorectal cancer (both genders).

### Cancer Incidence

Incidence rates (or case rates) reflect the number of newly diagnosed cases in a given population in a given year, regardless of outcome. They are usually expressed as cases per 100,000 population per year. Here, these rates are also age-adjusted.

### Cancer Incidence Rates by Site
(Annual Average Age-Adjusted Incidence per 100,000 Population, 2007-2011)

Sources:
- This indicator reports the age adjusted incidence rate (cases per 100,000 population per year) of cancers, adjusted to 2000 US standard population age groups (under age 1, 1-4, 5-9, ... 80-84, 85 and older). This indicator is relevant because cancer is a leading cause of death and it is important to identify cancers separately to better target interventions.

Cancer Risk

About Cancer Risk

Reducing the nation’s cancer burden requires reducing the prevalence of behavioral and environmental factors that increase cancer risk.

- All cancers caused by cigarette smoking could be prevented. At least one-third of cancer deaths that occur in the United States are due to cigarette smoking.
- According to the American Cancer Society, about one-third of cancer deaths that occur in the United States each year are due to nutrition and physical activity factors, including obesity.
- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Cancer Screenings

The American Cancer Society recommends that both men and women get a cancer-related checkup during a regular doctor’s checkup. It should include examination for cancers of the thyroid, testicles, ovaries, lymph nodes, oral cavity, and skin, as well as health counseling about tobacco, sun exposure, diet and nutrition, risk factors, sexual practices, and environmental and occupational exposures.

Screening levels in the community were measured in the PRC Community Health Survey relative to: female breast cancer (mammography); cervical cancer (Pap smear testing); and colorectal cancer (sigmoidoscopy and fecal occult blood testing).
**Female Breast Cancer Screening**

**About Screening for Breast Cancer**

The US Preventive Services Task Force (USPSTF) recommends screening mammography, with or without clinical breast examination (CBE), every 1-2 years for women age 40 and older.

Rationale: The USPSTF found fair evidence that mammography screening every 12-33 months significantly reduces mortality from breast cancer. Evidence is strongest for women age 50-69, the age group generally included in screening trials. For women age 40-49, the evidence that screening mammography reduces mortality from breast cancer is weaker, and the absolute benefit of mammography is smaller, than it is for older women. Most, but not all, studies indicate a mortality benefit for women undergoing mammography at ages 40-49, but the delay in observed benefit in women younger than 50 makes it difficult to determine the incremental benefit of beginning screening at age 40 rather than at age 50.

The absolute benefit is smaller because the incidence of breast cancer is lower among women in their 40s than it is among older women. The USPSTF concluded that the evidence is also generalizable to women age 70 and older (who face a higher absolute risk for breast cancer) if their life expectancy is not compromised by comorbid disease. The absolute probability of benefits of regular mammography increase along a continuum with age, whereas the likelihood of harms from screening (false-positive results and unnecessary anxiety, biopsies, and cost) diminish from ages 40-70. The balance of benefits and potential harms, therefore, grows more favorable as women age. The precise age at which the potential benefits of mammography justify the possible harms is a subjective choice. The USPSTF did not find sufficient evidence to specify the optimal screening interval for women age 40-49.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

**Cervical Cancer Screenings**

**About Screening for Cervical Cancer**

The US Preventive Services Task Force (USPSTF) strongly recommends screening for cervical cancer in women who have been sexually active and have a cervix.

Rationale: The USPSTF found good evidence from multiple observational studies that screening with cervical cytology (Pap smears) reduces incidence of and mortality from cervical cancer. Direct evidence to determine the optimal starting and stopping age and interval for screening is limited. Indirect evidence suggests most of the benefit can be obtained by beginning screening within 3 years of onset of sexual activity or age 21 (whichever comes first) and screening at least every 3 years. The USPSTF concludes that the benefits of screening substantially outweigh potential harms.

The USPSTF recommends against routinely screening women older than age 65 for cervical cancer if they have had adequate recent screening with normal Pap smears and are not otherwise at high risk for cervical cancer.

Rationale: The USPSTF found limited evidence to determine the benefits of continued screening in women older than 65. The yield of screening is low in previously screened women older than 65 due to the declining incidence of high-grade cervical lesions after middle age. There is fair evidence that screening women older than 65 is associated with an increased risk for potential harms, including false-positive results and invasive procedures. The USPSTF concludes that the potential harms of screening are likely to exceed benefits among older women who have had normal results previously and who are not otherwise at high risk for cervical cancer.

The USPSTF recommends against routine Pap smear screening in women who have had a total hysterectomy for benign disease.

Rationale: The USPSTF found fair evidence that the yield of cytologic screening is very low in women after hysterectomy and poor evidence that screening to detect vaginal cancer improves health outcomes. The USPSTF concludes that potential harms of continued screening after hysterectomy are likely to exceed benefits.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.
Colorectal Cancer Screenings

About Screening for Colorectal Cancer

The USPSTF recommends screening for colorectal cancer using fecal occult blood testing, sigmoidoscopy, or colonoscopy in adults, beginning at age 50 years and continuing until age 75 years.

The evidence is convincing that screening for colorectal cancer with fecal occult blood testing, sigmoidoscopy, or colonoscopy detects early-stage cancer and adenomatous polyps. There is convincing evidence that screening with any of the three recommended tests (FOBT, sigmoidoscopy, colonoscopy) reduces colorectal cancer mortality in adults age 50 to 75 years. Follow-up of positive screening test results requires colonoscopy regardless of the screening test used.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

Breast Cancer Screening: “A mammogram is an x-ray of each breast to look for cancer. How long has it been since you had your last mammogram?” (Calculated below among women age 50 to 74 indicating screening within the past 2 years.)

Cervical Cancer Screening: “A Pap test is a test for cancer of the cervix. How long has it been since you had your last Pap test?” (Calculated below among women age 21 to 65 indicating screening within the past 3 years.)

Colorectal Cancer Screening: “Sigmoidoscopy and colonoscopy are exams in which a tube is inserted in the rectum to view the colon for signs of cancer or other health problems. How long has it been since your last sigmoidoscopy or colonoscopy?” and “A blood stool test is a test that may use a special kit at home to determine whether the stool contains blood. How long has it been since you had your last blood stool test?” (Calculated below among both genders age 50 to 75 indicating fecal occult blood testing within the past year and/or sigmoidoscopy/colonoscopy [lower endoscopy] within the past 10 years.)
Key Informant Input: Cancer

The following chart outlines key informants’ perceptions of the severity of Cancer as a problem in the community:

**Top Concerns**

Among those rating this issue as a “major problem,” reasons frequently related to the following:

**Prevention & Early Detection**

*Not enough cancer prevention programs in the community.* – Public Health Expert

*Due to lack of screening for early detection purposes. Not because of lack of availability but rather because of lack of education to access the services.* – Community/Business Leader

*Very low income. People don’t get to the doctor for preventative or early detection services so don’t seek treatment until they have advanced illness.* – Social Services Representative
Poor access to screening. Poor adherence to screening guidelines. Late detection, unnecessarily high mortality rates. – Public Health Expert

At-Risk Populations

It's a major problem in communities of color. There are more and more people who are diagnosed. – Social Services Representative

People of color are desperately impacted in most forms of cancer. – Health Provider (Non-Physician)

While Latinos have lower incidence rates for some cancers, they have higher rates for some others. They also have later detection rates and social determinants of health that impede adequate wellness support during and after treatment. – Social Services Representative

High Cancer Rates

This case of cancer in the community are growing. There are lack of knowledge of education, prevent and screening regarding the issue of cancer. – Social Services Representative

Data show it to be. – Physician

Cost of Cancer Medications

There is very good hospital based care and treatment but the drug costs are soaring and with high deductible plans patients are more and more responsible for the expense and it has caused access issues, as has the reduced Medicare and commercial insurer reimbursement for the drugs and the associated administration of the drugs. Most of these drugs require administration by trained medical professionals. – Physician

Access to Specialists

There is little access locally to specialists. – Community/Business Leader
Respiratory Disease

**About Asthma & COPD**

Asthma and chronic obstructive pulmonary disease (COPD) are significant public health burdens. Specific methods of detection, intervention, and treatment exist that may reduce this burden and promote health.

Asthma is a chronic inflammatory disorder of the airways characterized by episodes of reversible breathing problems due to airway narrowing and obstruction. These episodes can range in severity from mild to life threatening. Symptoms of asthma include wheezing, coughing, chest tightness, and shortness of breath. Daily preventive treatment can prevent symptoms and attacks and enable individuals who have asthma to lead active lives.

COPD is a preventable and treatable disease characterized by airflow limitation that is not fully reversible. The airflow limitation is usually progressive and associated with an abnormal inflammatory response of the lung to noxious particles or gases (typically from exposure to cigarette smoke). Treatment can lessen symptoms and improve quality of life for those with COPD.

The burden of respiratory diseases affects individuals and their families, schools, workplaces, neighborhoods, cities, and states. Because of the cost to the healthcare system, the burden of respiratory diseases also falls on society; it is paid for with higher health insurance rates, lost productivity, and tax dollars. Annual healthcare expenditures for asthma alone are estimated at $20.7 billion.

**Asthma.** The prevalence of asthma has increased since 1980. However, deaths from asthma have decreased since the mid-1990s. The causes of asthma are an active area of research and involve both genetic and environmental factors.

Risk factors for asthma currently being investigated include:

- Having a parent with asthma
- Sensitization to irritants and allergens
- Respiratory infections in childhood
- Overweight

Asthma affects people of every race, sex, and age. However, significant disparities in asthma morbidity and mortality exist, in particular for low-income and minority populations. Populations with higher rates of asthma include: children; women (among adults) and boys (among children); African Americans; Puerto Ricans; people living in the Northeast United States; people living below the Federal poverty level; and employees with certain exposures in the workplace.

While there is not a cure for asthma yet, there are diagnoses and treatment guidelines that are aimed at ensuring that all people with asthma live full and active lives.

- [Healthy People 2020](www.healthypeople.gov)

[NOTE: COPD was changed to chronic lower respiratory disease (CLRD) with the introduction of ICD-10 codes. CLRD is used in vital statistics reporting, but COPD is still widely used and commonly found in surveillance reports.]

**Age-Adjusted Respiratory Disease Deaths**

Chronic lower respiratory diseases (CLRD) are diseases affecting the lungs; the most deadly of these is chronic obstructive pulmonary disease (COPD), which includes emphysema and chronic bronchitis.

Pneumonia and influenza mortality is also illustrated in the following chart. For prevalence of vaccinations against pneumonia and influenza, see also *Immunization & Infectious Disease.*
Town-level mortality rates are shown below.

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Asthma

Asthma. – Physician
Very high rates of asthma. 40% or more for students in our schools. – Community/Business Leader
Can be life threatening. – Health Provider (Non-Physician)
Tobacco use. Poor indoor air quality. Lack of affordable housing. High asthma rates. – Public Health Expert

Pollution

This is primarily due to the excessive amount of pollution in the community. – Health Provider (Non-Physician)

Disease Management

Patients not following the doctor’s orders and follow up care. – Health Provider (Non-Physician)

At-Risk Populations

Latinos in CT suffer disproportionate rates of asthma and of inadequate asthma management. – Social Services Representative
**Injury & Violence**

**About Injury & Violence**

Injuries and violence are widespread in society. Both unintentional injuries and those caused by acts of violence are among the top 15 killers for Americans of all ages. Many people accept them as “accidents,” “acts of fate,” or as “part of life.” However, most events resulting in injury, disability, or death are predictable and preventable.

Injuries are the leading cause of death for Americans ages 1 to 44, and a leading cause of disability for all ages, regardless of sex, race/ethnicity, or socioeconomic status. More than 180,000 people die from injuries each year, and approximately 1 in 10 sustains a nonfatal injury serious enough to be treated in a hospital emergency department.

Beyond their immediate health consequences, injuries and violence have a significant impact on the well-being of Americans by contributing to:

- Premature death
- Disability
- Poor mental health
- High medical costs
- Lost productivity

The effects of injuries and violence extend beyond the injured person or victim of violence to family members, friends, coworkers, employers, and communities.

Numerous factors can affect the risk of unintentional injury and violence, including individual behaviors, physical environment, access to health services (ranging from pre-hospital and acute care to rehabilitation), and social environment (from parental monitoring and supervision of youth to peer group associations, neighborhoods, and communities).

Interventions addressing these social and physical factors have the potential to prevent unintentional injuries and violence. Efforts to prevent unintentional injury may focus on:

- Modifications of the environment
- Improvements in product safety
- Legislation and enforcement
- Education and behavior change
- Technology and engineering

Efforts to prevent violence may focus on:

- Changing social norms about the acceptability of violence
- Improving problem-solving skills (for example, parenting, conflict resolution, coping)
- Changing policies to address the social and economic conditions that often give rise to violence

Healthy People 2020 (www.healthypeople.gov)
Leading Causes of Accidental Death

Leading causes of accidental death in the area include the following:

![Leading Causes of Accidental Death](image)

**Notes:**
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent's household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 199% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Bicycle Safety

Children Age 5-17: “In the past year, how often has this child worn a bicycle helmet when riding a bicycle? Would you say: always, nearly always, sometimes, seldom, or never?”

Child “Always” Wears a Helmet When Riding a Bicycle
(Among Parents of Children Age 5-17)

Firearms

Age-Adjusted Firearm-Related Deaths

The following chart outlines the age-adjusted mortality rate in the area attributed to firearms (including both accidental and intentional discharge), compared to state and national rates.

Firearms-Related Deaths: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 9.3 or Lower
Presence of Firearms in Homes

“Are there any firearms now kept in or around your home, including those kept in a garage, outdoor storage area, truck, or car? For the purposes of this inquiry, ‘firearms’ include pistols, shotguns, rifles, and other types of guns, but do NOT include starter pistols, BB guns, or guns that cannot fire.”

“An unlocked firearm is one that does NOT need a key or combination to get to the gun or fire it. The safety is NOT counted as a lock. Are any of these firearms unlocked?” and “Are any of these unlocked firearms now loaded?” (Calculated below as the percentage of respondents who have firearms at home and who keep at least one firearm unlocked and loaded.)

Have a Firearm Kept in or Around the House
(HOCC Service Area, 2015)

Intentional Injury (Violence)

Violent Crime

Violent crime is composed of four offenses (FBI Index offenses): murder and non-negligent manslaughter; forcible rape; robbery; and aggravated assault. Note that the quality of crime data can vary widely from location to location, depending on the consistency and completeness of reporting among various jurisdictions.
Violent Crime Experience: “Have you been the victim of a violent crime in your area in the past 5 years?”

Intimate Partner Violence: “The next questions are about different types of violence in relationships with an intimate partner. By an intimate partner, I mean any current or former spouse, boyfriend, or girlfriend. Someone you were dating, or romantically or sexually intimate with, would also be considered an intimate partner. Has an intimate partner ever hit, slapped, pushed, kicked, or hurt you in any way?”

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

**Gang Activity & Youth Violence**

*Every day there are people in my community either getting killed or injured due to guns, gang related matters, drug problems, etc.* – Social Services Representative

*We have a lot of gang activity.* – Health Provider (Non-Physician)

*There is a high prevalence of community violence and gang involvement in Hartford. Many young people are negatively influenced by peers and end up in unsafe situations. Many residents do not feel safe because of the violence and research has demonstrated the impact of high levels of community violence on child development and the stress that it creates which is can impact social/emotional development and wellbeing.* – Community/Business Leader

*Our students are affected by high rates of violence in our community.* – Community/Business Leader

**Environment & Economic Stressors**

*Hartford is an urban center with a significantly economically stressed population. Injury and violence statistics vary by neighborhood, but are above state averages.* – Community/Business Leader

*Poverty, people have many daily issues and they used substances, have little hope and are frustrated with their life and then resort to utilizing poor skills.* – Health Provider (Non-Physician)

*I believe that there is more harm done to children through intentional or unintentional injury than any childhood illness. The long term effects of being exposed to violence at an early age is not something we measure, but impacts our health system, educational system and judicial system. Access to weapons is a problem when mixed with stress, poverty, etc. Many unintentional injuries are easily preventable, but a hurried lifestyle along with "it won’t happen to me” attitude are bad combinations.* – Health Provider (Non-Physician)

*Unsafe housing conditions. Lack of safe play spaces. Young parents with lack of parenting skills, abuse and neglect.* – Public Health Expert
Domestic Violence

Domestic violence is an ongoing issue and more needs to be done tied to helping physicians and other clinicians identify and then help direct patients who have been a victim of domestic violence. There is also a need for interpreter services tied to communicating with those often who have been abused. – Physician

Domestic violence and youth violence. – Community/Business Leader

Many of these are preventable, so you would expect to see this decreasing as knowledge is disseminated. Instead we see family violence and unintentional injuries repeated generation after generation. – Social Services Representative

Prevalence of Violence

Homicide and other intentional injury. Alcohol-related injury. – Physician

Studies/assessments have determined that to be the case. – Community/Business Leader

Homelessness

The community I am referring to is those experiencing or at risk of homelessness. For women and families, domestic violence is often related to episodes of homelessness. Also, for those experiencing homelessness, the threat of injury and violence is a significant issue. – Community/Business Leader
About Diabetes

Diabetes mellitus occurs when the body cannot produce or respond appropriately to insulin. Insulin is a hormone that the body needs to absorb and use glucose (sugar) as fuel for the body’s cells. Without a properly functioning insulin signaling system, blood glucose levels become elevated and other metabolic abnormalities occur, leading to the development of serious, disabling complications. Many forms of diabetes exist; the three common types are Type 1, Type 2, and gestational diabetes. Effective therapy can prevent or delay diabetic complications.

Diabetes mellitus:
- Lowers life expectancy by up to 15 years.
- Increases the risk of heart disease by 2 to 4 times.
- Is the leading cause of kidney failure, lower limb amputations, and adult-onset blindness.

The rate of diabetes mellitus continues to increase both in the United States and throughout the world. Due to the steady rise in the number of persons with diabetes mellitus, and possibly earlier onset of type 2 diabetes mellitus, there is growing concern about the possibility that the increase in the number of persons with diabetes mellitus and the complexity of their care might overwhelm existing healthcare systems.

People from minority populations are more frequently affected by type 2 diabetes. Minority groups constitute 25% of all adult patients with diabetes in the US and represent the majority of children and adolescents with type 2 diabetes.

Lifestyle change has been proven effective in preventing or delaying the onset of type 2 diabetes in high-risk individuals.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Diabetes Deaths

Age-adjusted diabetes mortality for the area is shown in the following chart.

- Note the Healthy People 2020 target (as adjusted to account for diabetes mellitus-coded deaths).

Challenges

Among those rating this issue as a “major problem,” the biggest challenges for people with diabetes are seen as:

Disease Management

*Management.* – Public Health Expert

*Disease management.* – Public Health Expert

*Staying on top of their medication management and practicing good nutrition.* – Health Provider (Non-Physician)

*The biggest challenge is being able to afford diabetic medication, having access to healthier food alternatives and the biggest challenge is changing eating habits.* – Health Provider (Non-Physician)

*Being diagnosed in the first place, then once diagnosed finding a primary care physician to help with ongoing care, then being able to afford medications then changing lifestyle to become healthier.* – Health Provider (Non-Physician)

*Prevention and access to treatment.* – Physician

At-Risk Populations

*Diabetes is an issue that is affecting the Latino community at an alarming rate. It is not just about education my community on what to eat and so on, but it is also about educating the community on how certain foods will affect diabetes and what are the best approaches. Adherence to meds is another factor, if a patient truly understands what these meds are for, side effects, etc. They will make better informed decisions.* – Social Services Representative

*Latinos have higher diabetes incidence and more complications and mortality due to diabetes. A randomized controlled trial conducted by Hartford Hosp., Yale Univ. and HHC provided in-home peer counseling to Latinos patients of HH with diabetes. Findings included: a) this intensive service model, 17 home visits in one year decreased the HbA1 (b) down one full point compared to .4 in the control group, and the difference was sustained six months post-intervention and c) gaps in care, care coordination and cultural competence identified by the hospital's clinical team that partnered in the study - including the need for in-hospital care coordination and cultural competence training. The peer counseling service ended when the study ended. HHC is pursuing ways to sustain funding for community health workers through the affordable care act, including specialized, intensive models like this one, that ultimately improve health and save health care dollars.* – Social Services Representative

*High risk population with socio-economic barriers to wellness and nutrition strategies to prevent or mitigate diabetes.* – Community/Business Leader

*A serious problem in communities of color, and may grow in the general population with high obesity rate.* – Community/Business Leader

Diabetes Education & Prevention

*Awareness to prevent onset of diabetes.* – Public Health Expert

*Diabetic patients with care GPAs for recommended services such as Optometry, Podiatry and Nutrition. Lacking appropriate education.* – Health Provider (Non-Physician)

*There are several challenge of people with diabetes including diabetes prevention, education and management.* – Social Services Representative

*Besides access to endocrinologists, patient education and information appears to be rather lacking, especially information in Spanish and other languages other than English.* – Physician
Diet, Exercise & Weight

I think two of the biggest challenges are obtaining quality nutritious food and maintaining proper physical activity levels. – Health Provider (Non-Physician)

Limited access to fresh fruit and vegetables. – Social Services Representative

Healthy eating. It is expensive to eat healthy. – Social Services Representative

Weight control. – Community/Business Leader

Prevalence of Diabetes

There is a high prevalence of diabetes in Hartford. Further we know obesity is a struggle and a high percentage of the population is overweight. Hartford is a food desert and there are a number of barriers to accessing healthy food and exercising. – Community/Business Leader

Studies/assessments have determined that to be the case. – Community/Business Leader
Alzheimer’s Disease

About Dementia

Dementia is the loss of cognitive functioning—thinking, remembering, and reasoning—to such an extent that it interferes with a person’s daily life. Dementia is not a disease itself, but rather a set of symptoms. Memory loss is a common symptom of dementia, although memory loss by itself does not mean a person has dementia. Alzheimer’s disease is the most common cause of dementia, accounting for the majority of all diagnosed cases.

Alzheimer’s disease is the 6th leading cause of death among adults age 18 years and older. Estimates vary, but experts suggest that up to 5.1 million Americans age 65 years and older have Alzheimer’s disease. These numbers are predicted to more than double by 2050 unless more effective ways to treat and prevent Alzheimer’s disease are found.

• Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Alzheimer’s Disease Deaths

Age-adjusted Alzheimer’s disease mortality rates for the region and select towns are outlined in the following charts.

Alzheimer's Disease: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)

Sources: CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted February 2015.

Notes:• Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
• Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
• Local, state and national data are simple three-year averages.

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Support for Patients & Caregivers
- Lack of support for caregivers. Financial and emotional burden on families with little to no available support. – Public Health Expert
- Insufficient community support for persons with dementia, Alzheimer’s. – Public Health Expert
Limited support, evaluation process and treatment regimens varied and not standardized. – Health Provider (Non-Physician)

Unsure of the prevalence, but the stress on families, especially when onset is rapid, can be debilitating. This is not solely about the individual. – Health Provider (Non-Physician)

Low-Income Seniors

Many low-income seniors do not have adequate support or advocacy to deal with these challenges. – Community/Business Leader

There is only an option for expensive care nothing exits for those who cannot afford it. – Health Provider (Non-Physician)

Lack of Geriatricians

Connecticut has a shortage or rather limited number of geriatricians and much of the care is limited to home care and nursing home facilities. There are simply not that many independently practicing geriatricians because the reimbursement is simply not sufficient. – Physician
Kidney Disease

About Chronic Kidney Disease

Chronic kidney disease and end-stage renal disease are significant public health problems in the United States and a major source of suffering and poor quality of life for those afflicted. They are responsible for premature death and exact a high economic price from both the private and public sectors. Nearly 25% of the Medicare budget is used to treat people with chronic kidney disease and end-stage renal disease.

Genetic determinants have a large influence on the development and progression of chronic kidney disease. It is not possible to alter a person’s biology and genetic determinants; however, environmental influences and individual behaviors also have a significant influence on the development and progression of chronic kidney disease. As a result, some populations are disproportionately affected. Successful behavior modification is expected to have a positive influence on the disease.

Diabetes is the most common cause of kidney failure. The results of the Diabetes Prevention Program (DPP) funded by the national Institute of Diabetes and Digestive and Kidney Diseases (NIDDK) show that moderate exercise, a healthier diet, and weight reduction can prevent development of type 2 diabetes in persons at risk.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Kidney Disease Deaths

Age-adjusted kidney disease mortality is described in the following charts.

Kidney Disease: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)

<table>
<thead>
<tr>
<th>Location</th>
<th>Death Rate (Deaths per 100,000 Population)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hartford County</td>
<td>14.7</td>
</tr>
<tr>
<td>CT</td>
<td>12.5</td>
</tr>
<tr>
<td>US</td>
<td>13.2</td>
</tr>
</tbody>
</table>

Sources: CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted February 2015.

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
- Local, state and national data are simple three-year averages.

2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes: Asked of all respondents.
Key Informant Input: Chronic Kidney Disease

The following chart outlines key informants’ perceptions of the severity of Chronic Kidney Disease as a problem in the community:

Perceptions of Chronic Kidney Disease
as a Problem in the Community
(Key Informants, 2015)

- Major Problem: 23.7%
- Moderate Problem: 42.1%
- Minor Problem: 23.7%
- No Problem At All: 10.5%

Sources: PRC Online Key Informant Survey, Professional Research Consultants, Inc.

Notes: Asked of all respondents.

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Related to Other Serious Health Issues
- Results from a number of other prevalent conditions. – Physician
- It leads to other serious ailments that can be life threatening. – Health Provider (Non-Physician)
- There are many different factors that leads to chronic Kidney disease such as diabetes or hypertension. – Social Services Representative

African American Community
- Chronic kidney disease is often suffered by members of the African American descent, which is the population group that makes up the majority of the Hartford area. This is due to the lack of proper diet, medical management of hypertension and diabetes, all of which are greatly suffered by members of this community as well. – Health Provider (Non-Physician)
- African Americans are three times more likely to experience kidney failure than whites. – Health Provider (Non-Physician)

Prevalence of Kidney Disease
- Studies/assessments have determined that to be the case. – Community/Business Leader

Lack of Nephrologists
- There are very few actively clinically practicing nephrologists in Connecticut that are not tied to academic medical centers, it makes access to ESRD care very trying for patients in the outlying areas. – Physician
Potentially Disabling Conditions

**About Arthritis, Osteoporosis & Chronic Back Conditions**

There are more than 100 types of arthritis. Arthritis commonly occurs with other chronic conditions, such as diabetes, heart disease, and obesity. Interventions to treat the pain and reduce the functional limitations from arthritis are important, and may also enable people with these other chronic conditions to be more physically active. Arthritis affects 1 in 5 adults and continues to be the most common cause of disability. It costs more than $128 billion per year. All of the human and economic costs are projected to increase over time as the population ages. There are interventions that can reduce arthritis pain and functional limitations, but they remain underused. These include: increased physical activity; self-management education; and weight loss among overweight/obese adults.

Osteoporosis is a disease marked by reduced bone strength leading to an increased risk of fractures (broken bones). In the United States, an estimated 5.3 million people age 50 years and older have osteoporosis. Most of these people are women, but about 0.8 million are men. Just over 34 million more people, including 12 million men, have low bone mass, which puts them at increased risk for developing osteoporosis. Half of all women and as many as 1 in 4 men age 50 years and older will have an osteoporosis-related fracture in their lifetime.

Chronic back pain is common, costly, and potentially disabling. About 80% of Americans experience low back pain in their lifetime. It is estimated that each year:

- 15%-20% of the population develop protracted back pain.
- 2-8% have chronic back pain (pain that lasts more than 3 months).
- 3-4% of the population is temporarily disabled due to back pain.
- 1% of the working-age population is disabled completely and permanently as a result of low back pain.

Americans spend at least $50 billion each year on low back pain. Low back pain is the:

- 2nd leading cause of lost work time (after the common cold).
- 3rd most common reason to undergo a surgical procedure.
- 5th most frequent cause of hospitalization.

Arthritis, osteoporosis, and chronic back conditions all have major effects on quality of life, the ability to work, and basic activities of daily living.

- Healthy People 2020 (www.healthypeople.gov)

**Arthritis, Osteoporosis, & Chronic Back Conditions**

"Would you please tell me if you have ever suffered from or been diagnosed with arthritis or rheumatism?" (Reported below among only those age 50+.)

"Would you please tell me if you have ever suffered from or been diagnosed with osteoporosis?" (Reported below among only those age 50+.)

"Would you please tell me if you have ever suffered from or been diagnosed with sciatica or chronic back pain?" (Reported below among all adults age 18+.)

Prevalence of Arthritis, Osteoporosis & Chronic Back Conditions

Key Informant Input: Arthritis, Osteoporosis & Chronic Back Conditions
The following chart outlines key informants’ perceptions of the severity of Arthritis, Osteoporosis & Chronic Back Conditions as a problem in the community:

Perceptions of Arthritis/Osteoporosis/Back Conditions as a Problem in the Community
(Key Informants, 2015)

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Prevalence
Is a common identified medical problem among our patients. – Health Provider (Non-Physician)
Common chronic condition leading to pain and disability. – Physician

Lack of Rheumatologists
There are fewer and fewer available Rheumatologists who are focusing full time on rheumatoid related conditions. Also, there are fewer clinically practicing orthopedists who are not hospital employed and who have available office hours. – Physician
Vision & Hearing Impairment

Vision Trouble

About Vision

Vision is an essential part of everyday life, influencing how Americans of all ages learn, communicate, work, play, and interact with the world. Yet millions of Americans live with visual impairment, and many more remain at risk for eye disease and preventable eye injury.

The eyes are an important, but often overlooked, part of overall health. Despite the preventable nature of some vision impairments, many people do not receive recommended screenings and exams. A visit to an eye care professional for a comprehensive dilated eye exam can help to detect common vision problems and eye diseases, including diabetic retinopathy, glaucoma, cataract, and age-related macular degeneration.

These common vision problems often have no early warning signs. If a problem is detected, an eye care professional can prescribe corrective eyewear, medicine, or surgery to minimize vision loss and help a person see his or her best.

Healthy vision can help to ensure a healthy and active lifestyle well into a person's later years. Educating and engaging families, communities, and the nation is critical to ensuring that people have the information, resources, and tools needed for good eye health.

- Healthy People 2020 (www.healthypeople.gov)

Hearing Trouble

About Hearing & Other Sensory or Communication Disorders

An impaired ability to communicate with others or maintain good balance can lead many people to feel socially isolated, have unmet health needs, have limited success in school or on the job. Communication and other sensory processes contribute to our overall health and well-being. Protecting these processes is critical, particularly for people whose age, race, ethnicity, gender, occupation, genetic background, or health status places them at increased risk.

Many factors influence the numbers of Americans who are diagnosed and treated for hearing and other sensory or communication disorders, such as social determinants (social and economic standings, age of diagnosis, cost and stigma of wearing a hearing aid, and unhealthy lifestyle choices). In addition, biological causes of hearing loss and other sensory or communication disorders include: genetics; viral or bacterial infections; sensitivity to certain drugs or medications; injury; and aging.

As the nation's population ages and survival rates for medically fragile infants and for people with severe injuries and acquired diseases improve, the prevalence of sensory and communication disorders is expected to rise.

- Healthy People 2020 (www.healthypeople.gov)

“Would you please tell me if you have ever suffered from or been diagnosed with blindness or trouble seeing, even when wearing glasses?”

“Would you please tell me if you have ever suffered from or been diagnosed with deafness or trouble hearing?”

- Note the higher prevalence among older adults (age 65+).
Prevalence of Vision & Hearing Difficulty

Key Informant Input: Vision & Hearing

The following chart outlines key informants’ perceptions of the severity of Vision & Hearing as a problem in the community:

Perceptions of Hearing and Vision as a Problem in the Community
(Key Informants, 2015)

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Cost of Services

Cost of hearing aids and the cost of glasses but also the availability of specialized ophthalmologic are limited, especially for Pediatrics. – Physician

The number of providers accepting Medicare/Medicaid is limited, especially in the rural areas my agency serves. – Health Provider (Non-Physician)

Growing Aging Population

There is growing aging population that these issues are starting to become a concern. – Social
Services Representative

Prevalence

High incidence of diabetes, cardiovascular disease with microvascular complications, including retinopathy. Macular degeneration is prevalent and impacts one's quality of life and at times safety with regard to discharge disposition. – Health Provider (Non-Physician)
Infectious Disease

About Immunization & Infectious Diseases

The increase in life expectancy during the 20th century is largely due to improvements in child survival; this increase is associated with reductions in infectious disease mortality, due largely to immunization. However, infectious diseases remain a major cause of illness, disability, and death. Immunization recommendations in the United States currently target 17 vaccine-preventable diseases across the lifespan.

People in the US continue to get diseases that are vaccine-preventable. Viral hepatitis, influenza, and tuberculosis (TB) remain among the leading causes of illness and death across the nation and account for substantial spending on the related consequences of infection.

The infectious disease public health infrastructure, which carries out disease surveillance at the national, state, and local levels, is an essential tool in the fight against newly emerging and re-emerging infectious diseases. Other important defenses against infectious diseases include:

- Proper use of vaccines
- Antibiotics
- Screening and testing guidelines
- Scientific improvements in the diagnosis of infectious disease-related health concerns

Vaccines are among the most cost-effective clinical preventive services and are a core component of any preventive services package. Childhood immunization programs provide a very high return on investment. For example, for each birth cohort vaccinated with the routine immunization schedule, society:

- Saves 33,000 lives.
- Prevents 14 million cases of disease.
- Reduces direct healthcare costs by $9.9 billion.
- Saves $33.4 billion in indirect costs.

Healthy People 2020 (www.healthypeople.gov)

Influenza & Pneumonia Vaccination

About Influenza & Pneumonia

Acute respiratory infections, including pneumonia and influenza, are the 8th leading cause of death in the nation, accounting for 56,000 deaths annually. Pneumonia mortality in children fell by 97% in the last century, but respiratory infectious diseases continue to be leading causes of pediatric hospitalization and outpatient visits in the US. On average, influenza leads to more than 200,000 hospitalizations and 36,000 deaths each year. The 2009 H1N1 influenza pandemic caused an estimated 270,000 hospitalizations and 12,270 deaths (1,270 of which were of people younger than age 18) between April 2009 and March 2010.

Healthy People 2020 (www.healthypeople.gov)
Flu Vaccinations

“There are two ways to get the seasonal flu vaccine, one is a shot in the arm and the other is a spray, mist, or drop in the nose called FluMist®. During the past 12 months, have you had either a seasonal flu shot or a seasonal flu vaccine that was sprayed in your nose?”

“A pneumonia shot or pneumococcal vaccine is usually given only once or twice in a person’s lifetime and is different from the seasonal flu shot. Have you ever had a pneumonia shot?”

Chart columns below show these findings among those age 65+. Percentages for “high-risk” adults age 18-64 in the Hospital of Central Connecticut Service Area are also shown; here, “high-risk” includes adults who report having been diagnosed with heart disease, diabetes or respiratory disease.)

Notes:
- Asked of all respondents.
- The Healthy People 2020 target for influenza vaccination is 70% for all populations; the targets for pneumonia vaccination are 90% for 65+ and 60% for other high-risk adults.
HIV

About HIV

The HIV epidemic in the United States continues to be a major public health crisis. An estimated 1.1 million Americans are living with HIV, and 1 in 5 people with HIV do not know they have it. HIV continues to spread, leading to about 56,000 new HIV infections each year.

HIV is a preventable disease, and effective HIV prevention interventions have been proven to reduce HIV transmission. People who get tested for HIV and learn that they are infected can make significant behavior changes to improve their health and reduce the risk of transmitting HIV to their sex or drug-using partners. More than 50% of new HIV infections occur as a result of the 21% of people who have HIV but do not know it.

In the era of increasingly effective treatments for HIV, people with HIV are living longer, healthier, and more productive lives. Deaths from HIV infection have greatly declined in the United States since the 1990s. As the number of people living with HIV grows, it will be more important than ever to increase national HIV prevention and healthcare programs.

There are gender, race, and ethnicity disparities in new HIV infections:

- Nearly 75% of new HIV infections occur in men.
- More than half occur in gay and bisexual men, regardless of race or ethnicity.
- 45% of new HIV infections occur in African Americans, 35% in whites, and 17% in Hispanics.

Improving access to quality healthcare for populations disproportionately affected by HIV, such as persons of color and gay and bisexual men, is a fundamental public health strategy for HIV prevention. People getting care for HIV can receive:

- Antiretroviral therapy
- Screening and treatment for other diseases (such as sexually transmitted infections)
- HIV prevention interventions
- Mental health services
- Other health services

As the number of people living with HIV increases and more people become aware of their HIV status, prevention strategies that are targeted specifically for HIV-infected people are becoming more important. Prevention work with people living with HIV focuses on:

- Linking to and staying in treatment.
- Increasing the availability of ongoing HIV prevention interventions.
- Providing prevention services for their partners.

Public perception in the US about the seriousness of the HIV epidemic has declined in recent years. There is evidence that risky behaviors may be increasing among uninfected people, especially gay and bisexual men. Ongoing media and social campaigns for the general public and HIV prevention interventions for uninfected persons who engage in risky behaviors are critical.

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

At-Risk Populations

- **Men who have sex with men (MSM) is the population with significantly increasing rate of HIV. There is not enough prevention education.** – Social Services Representative
- **There are growing cases of HIV/AIDS in women of color and the senior population. This is due to a number of reasons but mostly lack of education and reinforce knowledge of sexual. HIV/AIDS is result of not practicing safe sex.** – Social Services Representative
- **As an HIV/AIDS organization, we are still engaging and diagnosing new cases. People are still thinking that it is not a major problem, but our young Latino and African American community is coming back infected.** – Social Services Representative
- **While HIV/AIDS incidence overall has declined, it affects Latino communities disproportionately, especially in the northeast/Connecticut. Latinos are more likely to be tested after the infection has progressed beyond the early stages of the disease.** – Social Services Representative
- **Studies/assessments have determined that to be the case, particularly among the black community.** – Community/Business Leader

Substance Abuse

- **HIV/AIDS ties directly in with substance abuse which is also a major problem in the Hartford area. Promiscuous activity and unprotected sex.** – Health Provider (Non-Physician)
- **High drug use.** – Health Provider (Non-Physician)
- **Lack of education. High substance abuse rates, risky behaviors.** – Public Health Expert

Prevalence of HIV/AIDS

- **There is a high prevalence of HIV/AIDS in Hartford compared to other CT communities. There is stigma associated with this illness and beliefs that residents hold that creates fear and keeps them from getting testing and treatment.** – Community/Business Leader
- **Data show.** – Physician
Sexually Transmitted Diseases

About Sexually Transmitted Diseases

STDs refer to more than 25 infectious organisms that are transmitted primarily through sexual activity. Despite their burdens, costs, and complications, and the fact that they are largely preventable, STDs remain a significant public health problem in the United States. This problem is largely unrecognized by the public, policymakers, and health care professionals. STDs cause many harmful, often irreversible, and costly clinical complications, such as: reproductive health problems; fetal and perinatal health problems; cancer; and facilitation of the sexual transmission of HIV infection.

Because many cases of STDs go undiagnosed—and some common viral infections, such as human papillomavirus (HPV) and genital herpes, are not reported to CDC at all—the reported cases of chlamydia, gonorrhea, and syphilis represent only a fraction of the true burden of STDs in the US. Untreated STDs can lead to serious long-term health consequences, especially for adolescent girls and young women. Several factors contribute to the spread of STDs.

Biological Factors. STDs are acquired during unprotected sex with an infected partner. Biological factors that affect the spread of STDs include:

- Asymptomatic nature of STDs. The majority of STDs either do not produce any symptoms or signs, or they produce symptoms so mild that they are unnoticed; consequently, many infected persons do not know that they need medical care.
- Gender disparities. Women suffer more frequent and more serious STD complications than men do. Among the most serious STD complications are pelvic inflammatory disease, ectopic pregnancy (pregnancy outside of the uterus), infertility, and chronic pelvic pain.
- Age disparities. Compared to older adults, sexually active adolescents ages 15 to 19 and young adults ages 20 to 24 are at higher risk for getting STDs.
- Lag time between infection and complications. Often, a long interval, sometimes years, occurs between acquiring an STD and recognizing a clinically significant health problem.

Social, Economic and Behavioral Factors. The spread of STDs is directly affected by social, economic, and behavioral factors. Such factors may cause serious obstacles to STD prevention due to their influence on social and sexual networks, access to and provision of care, willingness to seek care, and social norms regarding sex and sexuality. Among certain vulnerable populations, historical experience with segregation and discrimination exacerbates these factors. Social, economic, and behavioral factors that affect the spread of STDs include: racial and ethnic disparities; poverty and marginalization; access to healthcare; substance abuse; sexuality and secrecy (stigma and discomfort discussing sex); and sexual networks (persons “linked” by sequential or concurrent sexual partners).

- Healthy People 2020 (www.healthypeople.gov)

Chlamydia & Gonorrhea

Chlamydia. Chlamydia is the most commonly reported STD in the United States; most people who have chlamydia don’t know it since the disease often has no symptoms.

Gonorrhea. Anyone who is sexually active can get gonorrhea. Gonorrhea can be cured with the right medication; left untreated, however, gonorrhea can cause serious health problems in both women and men.

The following charts outline local incidence for these STDs.
**Chlamydia & Gonorrhea Incidence**

**Top Concerns**

Among those rating this issue as a “major problem,” reasons frequently related to the following:

**At-Risk Populations**

- *CT has a high incidence of STI’s, Gonorrhea, Chlamydia and Syphilis are in high numbers in my community, especially within the young MSM community and other youth.* – Social Services Representative
- *Gonorrhea, chlamydia and syphilis have higher incidence rates in Hartford than elsewhere in the state and rates are disproportionately high among Latinos and Blacks. There has been a major increase in prevalence of syphilis.* – Social Services Representative
- *Men who have sex with men account for the vast majority of syphilis cases in CT. Some are co-infected with HIV. They also test positive for other STD’s.* – Social Services Representative
- *Contributing factors include low income young pregnant teens. Unable to afford the cost of protection.* – Health Provider (Non-Physician)

**Prevalence of STDs**

- *Hartford has high rates/100K of STDs, including Chlamydia, Gonorrhea Hepatitis C, etc. compared to most other communities in CT. Others of the larger cities have similar rates to Hartford.* – Community/Business Leader
- *We have seen a slow but steady increase in Chlamydia over the last few years.* – Community/Business Leader

**Education**

- *People need more educational services on practicing safe sex.* – Health Provider (Non-Physician)

**Risky Behaviors**

- *Misinformation. Substance abuse leading to risky sexual behaviors. Mental illness leading to risky sexual behaviors. Lack of education.* – Public Health Expert

**Immunization & Infectious Diseases**

**Key Informant Input: Immunization & Infectious Diseases**

The following chart outlines key informants’ perceptions of the severity of Immunization & Infectious Diseases as a problem in the community:

*Notes: Asked of all respondents.*
Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Education & Access

- Lack of education. Poor life management skills. Lack of access to primary care. – Public Health Expert
- Preventable diseases. – Physician
- Can affect all sorts of physical ramifications if not treated. – Health Provider (Non-Physician)

Lack of Resources

- We don't have any resources that I know of. I have heard of people needing to travel to UConn Health Center for treatment. – Community/Business Leader
Births

Prenatal Care

About Infant & Child Health

Improving the well-being of mothers, infants, and children is an important public health goal for the US. Their well-being determines the health of the next generation and can help predict future public health challenges for families, communities, and the healthcare system. The risk of maternal and infant mortality and pregnancy-related complications can be reduced by increasing access to quality preconception (before pregnancy) and inter-conception (between pregnancies) care. Moreover, healthy birth outcomes and early identification and treatment of health conditions among infants can prevent death or disability and enable children to reach their full potential. Many factors can affect pregnancy and childbirth, including pre-conception health status, age, access to appropriate healthcare, and poverty.

Infant and child health are similarly influenced by socio-demographic factors, such as family income, but are also linked to the physical and mental health of parents and caregivers. There are racial and ethnic disparities in mortality and morbidity for mothers and children, particularly for African Americans. These differences are likely the result of many factors, including social determinants (such as racial and ethnic disparities in infant mortality; family income; educational attainment among household members; and health insurance coverage) and physical determinants (i.e., the health, nutrition, and behaviors of the mother during pregnancy and early childhood).

- Healthy People 2020 (www.healthypeople.gov)

Early and continuous prenatal care is the best assurance of infant health. Receipt of timely prenatal care (care initiated during the first trimester of pregnancy) is outlined in the following charts.

- Note the Healthy People 2020 target.

Lack of Prenatal Care in the First Trimester
(By Race; Percentage of Live Births, 2011)

Sources:
- Connecticut Department of Public Health.

Note:
- This indicator reports the percentage of women who do not obtain prenatal care during their first trimester of pregnancy. This indicator is relevant because engaging in prenatal care decreases the likelihood of maternal and infant health risks. This indicator can also highlight a lack of access to preventive care, a lack of health knowledge, insufficient provider outreach, and/or social barriers preventing utilization of services.
Birth Outcomes & Risks

Low-Weight Births

Low birthweight babies, those who weigh less than 2,500 grams (5 pounds, 8 ounces) at birth, are much more prone to illness and neonatal death than are babies of normal birthweight. Largely a result of receiving poor or inadequate prenatal care, many low-weight births and the consequent health problems are preventable. Births of low-weight infants are described in the following charts.

- Note the Healthy People 2020 target.
Low-Weight Births
(Percent of Live Births, 2011-2013)
Healthy People 2020 Target = 7.8% or Lower

Sources:

Note:
- This indicator reports the percentage of total births that are low birth weight (Under 2500g). This indicator is relevant because low birth weight infants are at high risk for health problems. This indicator can also highlight the existence of health disparities.

Percent of Births With Low Birthweight
(By Select Towns in the HOCC Service Area, 2011)

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Barriers to Access to Care

While there have been major improvements in immunization rates, there continue to be barriers to adequate access to primary care. In addition, infant mortality rates are disproportionately high compared to state and national rates. Childhood overweight and obesity is a major problem, as is asthma. Breastfeeding incidence, duration and exclusivity rates have continued to improve, but have a long way to go citywide. – Social Services Representative

Families do not have the funds to adequately take care of children. – Health Provider (Non-Physician)

This is really only tied to Medicaid where there are some problems with the number of pediatric specialists in Husky/Medicaid. – Physician

Timely access and transportation are challenging for many families. Also, some parents and other caregivers are not informed about proper infant and child health. – Community/Business Leader

Infants of uninsured moms often skip recommended required vaccines. Records of undocumented difficult to obtain. Lack of nutritional education for obese children. – Health Provider (Non-Physician)

Prevalence of Child Health Concerns

There are a number of issues that seem to be on the rise, obesity, asthma, autism and behavioral challenges. – Health Provider (Non-Physician)

High asthma rates continue to be a major health issue for our students/families. – Community/Business Leader

Studies/assessments have determined that to be the case. – Community/Business Leader

Learning, nutrition, infant mortality. – Physician

Statistically the town of Manchester has seen a higher than state average in pregnancy and infant loss. – Public Health Expert

Neglected children. Poor access to childcare. Lack of access to primary care. Immigrant population. Food insecurity. – Public Health Expert
Family Planning

Births to Teen Mothers

About Teen Births

The negative outcomes associated with unintended pregnancies are compounded for adolescents. Teen mothers:

- Are less likely to graduate from high school or attain a GED by the time they reach age 30.
- Earn an average of approximately $3,500 less per year, when compared with those who delay childbearing.
- Receive nearly twice as much Federal aid for nearly twice as long.

Similarly, early fatherhood is associated with lower educational attainment and lower income. Children of teen parents are more likely to have lower cognitive attainment and exhibit more behavior problems. Sons of teen mothers are more likely to be incarcerated, and daughters are more likely to become adolescent mothers.

- Healthy People 2020 (www.healthypeople.gov)

The following charts describe local teen births.

### Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

#### Teen Births

- High teen birth rate and low birth weight. – Physician
- Teen pregnancy continue to be an issue in our community. – Public Health Expert
- Teen pregnancy remains an issue in our school community. – Community/Business Leader
- I think many young woman have unplanned pregnancy and are not emotionally or practically prepared for parenthood. While many choose to have the baby, it is a struggle and greatly impacts their life choices (i.e. education, work, job training). In additional many young mothers have emotional struggles from their childhood and need support in working through them (i.e. counseling, parenting education, support groups). – Community/Business Leader

#### Access to Care

- Lack of easy access to long term birth control. – Social Services Representative
- It's not so much about family planning as about women having consistent access to pre-conception and pre-natal care regardless of income. – Community/Business Leader

#### Education

- Lack of education. Competing priorities. Lack of life skills. – Public Health Expert

#### Lack of Primary Care Physicians

- Our demographic is changing dramatically and wellness is critical. We have a shortage of primary care doctors. – Community/Business Leader
Modifiable Health Risks

Actual Causes Of Death

About Contributors to Mortality

A 1999 study (an update to a landmark 1993 study), estimated that as many as 40% of premature deaths in the United States are attributed to behavioral factors. This study found that behavior patterns represent the single-most prominent domain of influence over health prospects in the United States. The daily choices we make with respect to diet, physical activity, and sex; the substance abuse and addictions to which we fall prey; our approach to safety; and our coping strategies in confronting stress are all important determinants of health.

The most prominent contributors to mortality in the United States in 2000 were tobacco (an estimated 435,000 deaths), diet and activity patterns (400,000), alcohol (85,000), microbial agents (75,000), toxic agents (55,000), motor vehicles (43,000), firearms (29,000), sexual behavior (20,000), and illicit use of drugs (17,000). Socioeconomic status and access to medical care are also important contributors, but difficult to quantify independent of the other factors cited. Because the studies reviewed used different approaches to derive estimates, the stated numbers should be viewed as first approximations.

These analyses show that smoking remains the leading cause of mortality. However, poor diet and physical inactivity may soon overtake tobacco as the leading cause of death. These findings, along with escalating healthcare costs and aging population, argue persuasively that the need to establish a more preventive orientation in the US healthcare and public health systems has become more urgent.

While causes of death are typically described as the diseases or injuries immediately precipitating the end of life, a few important studies have shown that the actual causes of premature death (reflecting underlying risk factors) are often preventable.

Nutrition, Physical Activity & Weight

Nutrition

**About Healthful Diet & Healthy Weight**

Strong science exists supporting the health benefits of eating a healthful diet and maintaining a healthy body weight. Efforts to change diet and weight should address individual behaviors, as well as the policies and environments that support these behaviors in settings such as schools, worksites, healthcare organizations, and communities.

The goal of promoting healthful diets and healthy weight encompasses increasing household food security and eliminating hunger.

Americans with a healthful diet:
- Consume a variety of nutrient-dense foods within and across the food groups, especially whole grains, fruits, vegetables, low-fat or fat-free milk or milk products, and lean meats and other protein sources.
- Limit the intake of saturated and trans fats, cholesterol, added sugars, sodium (salt), and alcohol.
- Limit caloric intake to meet caloric needs.

Diet and body weight are related to health status. Good nutrition is important to the growth and development of children. A healthful diet also helps Americans reduce their risks for many health conditions, including: overweight and obesity; malnutrition; iron-deficiency anemia; heart disease; high blood pressure; dyslipidemia (poor lipid profiles); type 2 diabetes; osteoporosis; oral disease; constipation; diverticular disease; and some cancers.

Diet reflects the variety of foods and beverages consumed over time and in settings such as worksites, schools, restaurants, and the home. Interventions to support a healthier diet can help ensure that:
- Individuals have the knowledge and skills to make healthier choices.
- Healthier options are available and affordable.

**Social Determinants of Diet.** Demographic characteristics of those with a more healthful diet vary with the nutrient or food studied. However, most Americans need to improve some aspect of their diet.

Social factors thought to influence diet include:
- Knowledge and attitudes
- Skills
- Social support
- Societal and cultural norms
- Food and agricultural policies
- Food assistance programs
- Economic price systems

**Physical Determinants of Diet.** Access to and availability of healthier foods can help people follow healthful diets. For example, better access to retail venues that sell healthier options may have a positive impact on a person’s diet; these venues may be less available in low-income or rural neighborhoods.

The places where people eat appear to influence their diet. For example, foods eaten away from home often have more calories and are of lower nutritional quality than foods prepared at home.

Marketing also influences people’s—particularly children’s—food choices.
- Healthy People 2020 (www.healthypeople.gov)
Daily Recommendation of Fruits/Vegetables

To measure fruit and vegetable consumption, survey respondents were asked multiple questions, specifically about the foods and drinks they consumed on the day prior to the interview.

“Now I would like you to think about the foods you ate or drank yesterday. Include all the foods you ate, both at home and away from home. How many servings of fruit or fruit juices did you have yesterday?”

“How many servings of vegetables did you have yesterday?”

The questions above are used to calculate daily fruit/vegetable consumption for adults at the respondent level. The proportion reporting having 5 or more servings per day is shown below.

### Consume Five or More Servings of Fruits/Vegetables Per Day

Notes:
- This indicator reports the percentage of the population living in census tracts designated as food deserts. A food desert is defined as low-income areas where a significant number or share of residents is far from a supermarket, where “far” is more than 1 mile in urban areas and more than 10 miles in rural areas. This indicator is relevant because it highlights populations and geographies facing food insecurity.
Physical Activity

**About Physical Activity**

Regular physical activity can improve the health and quality of life of Americans of all ages, regardless of the presence of a chronic disease or disability. Among adults and older adults, physical activity can lower the risk of: early death; coronary heart disease; stroke; high blood pressure; type 2 diabetes; breast and colon cancer; falls; and depression. Among children and adolescents, physical activity can: improve bone health; improve cardiorespiratory and muscular fitness; decrease levels of body fat; and reduce symptoms of depression. For people who are inactive, even small increases in physical activity are associated with health benefits.

Personal, social, economic, and environmental factors all play a role in physical activity levels among youth, adults, and older adults. Understanding the barriers to and facilitators of physical activity is important to ensure the effectiveness of interventions and other actions to improve levels of physical activity.

Factors **positively** associated with adult physical activity include: postsecondary education; higher income; enjoyment of exercise; expectation of benefits; belief in ability to exercise (self-efficacy); history of activity in adulthood; social support from peers, family, or spouse; access to and satisfaction with facilities; enjoyable scenery; and safe neighborhoods.

Factors **negatively** associated with adult physical activity include: advancing age; low income; lack of time; low motivation; rural residency; perception of great effort needed for exercise; overweight or obesity; perception of poor health; and being disabled. Older adults may have additional factors that keep them from being physically active, including lack of social support, lack of transportation to facilities, fear of injury, and cost of programs.

Among children ages 4 to 12, the following factors have a positive association with physical activity: gender (boys); belief in ability to be active (self-efficacy); and parental support.

Among adolescents ages 13 to 18, the following factors have a positive association with physical activity: parental education; gender (boys); personal goals; physical education/school sports; belief in ability to be active (self-efficacy); and support of friends and family.

Environmental influences positively associated with physical activity among children and adolescents include:

- Presence of sidewalks
- Having a destination/walking to a particular place
- Access to public transportation
- Low traffic density
- Access to neighborhood or school play area and/or recreational equipment

People with disabilities may be less likely to participate in physical activity due to physical, emotional, and psychological barriers. Barriers may include the inaccessibility of facilities and the lack of staff trained in working with people with disabilities.

* Healthy People 2020 (www.healthypeople.gov)
Recommended Levels of Physical Activity

Adults (age 18–64) should do 2 hours and 30 minutes a week of moderate-intensity, or 1 hour and 15 minutes (75 minutes) a week of vigorous-intensity aerobic physical activity, or an equivalent combination of moderate- and vigorous-intensity aerobic physical activity. Aerobic activity should be performed in episodes of at least 10 minutes, preferably spread throughout the week.

Additional health benefits are provided by increasing to 5 hours (300 minutes) a week of moderate-intensity aerobic physical activity, or 2 hours and 30 minutes a week of vigorous-intensity physical activity, or an equivalent combination of both.

Older adults (age 65 and older) should follow the adult guidelines. If this is not possible due to limiting chronic conditions, older adults should be as physically active as their abilities allow. They should avoid inactivity. Older adults should do exercises that maintain or improve balance if they are at risk of falling.

For all individuals, some activity is better than none. Physical activity is safe for almost everyone, and the health benefits of physical activity far outweigh the risks.

Physical Activity Levels
Leisure-Time Physical Activity.  Leisure-time physical activity includes any physical activities or exercises (such as running, calisthenics, golf, gardening, walking, etc.) which take place outside of one’s line of work.

“During the past month, other than your regular job, did you participate in any physical activities or exercises, such as running, calisthenics, golf, gardening, or walking for exercise?”

- Note the corresponding Healthy People 2020 target in the chart below.

Meeting Physical Activity Recommendations.  Meeting physical activity requirements means satisfying a minimum threshold of minutes per week with a combination of vigorous- and/or moderate-intensity physical activity (as determined from the questions below).  These thresholds are described in the orange box above.

“Vigorous activities cause large increases in breathing or heart rate, while moderate activities cause small increases in breathing or heart rate.  Now, thinking about when you are not working, how many days per week or per month do you do vigorous activities for at least 20 minutes at a time, such as running, aerobics, heavy yard work, or anything else that causes large increases in breathing and heart rate?”

“And on how many days per week or per month do you do moderate activities for at least 30 minutes at a time, such as brisk walking, bicycling, vacuuming, gardening, or anything else that causes some increase in breathing or heart rate?”
Sources:  2015 PRC Community Health Survey, Professional Research Consultants, Inc.  [Items 92, 147]
2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
• Asked of all respondents.
• In this case the term “meets physical activity recommendations” refers to participation in moderate physical activity (exercise that produces only light sweating or a slight to moderate increase in breathing or heart rate) at least 5 times a week for 30 minutes at a time, and/or vigorous physical activity (activities that cause heavy sweating or large increases in breathing or heart rate) at least 3 times a week for 20 minutes at a time.

No Leisure-Time Physical Activity in the Past Month
Healthy People 2020 Target = 32.6% or Lower

Meets Physical Activity Recommendations

2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes: Asked of all respondents with children age 2-17 at home.
Includes children reported to have one or more hours of physical activity on each of the seven days preceding the survey.
Weight Status

**About Overweight & Obesity**

Because weight is influenced by energy (calories) consumed and expended, interventions to improve weight can support changes in diet or physical activity. They can help change individuals’ knowledge and skills, reduce exposure to foods low in nutritional value and high in calories, or increase opportunities for physical activity. Interventions can help prevent unhealthy weight gain or facilitate weight loss among obese people. They can be delivered in multiple settings, including healthcare settings, worksites, or schools.

The social and physical factors affecting diet and physical activity (see Physical Activity topic area) may also have an impact on weight. Obesity is a problem throughout the population. However, among adults, the prevalence is highest for middle-aged people and for non-Hispanic black and Mexican American women. Among children and adolescents, the prevalence of obesity is highest among older and Mexican American children and non-Hispanic black girls. The association of income with obesity varies by age, gender, and race/ethnicity.

- Healthy People 2020 (www.healthypeople.gov)

Body Mass Index (BMI), which describes relative weight for height, is significantly correlated with total body fat content. The BMI should be used to assess overweight and obesity and to monitor changes in body weight. In addition, measurements of body weight alone can be used to determine efficacy of weight loss therapy. BMI is calculated as weight (kg)/height squared (m²). To estimate BMI using pounds and inches, use: [weight (pounds)/height squared (inches²)] x 703.

In this report, overweight is defined as a BMI of 25.0 to 29.9 kg/m² and obesity as a BMI ≥30 kg/m². The rationale behind these definitions is based on epidemiological data that show increases in mortality with BMIs above 25 kg/m². The increase in mortality, however, tends to be modest until a BMI of 30 kg/m² is reached. For persons with a BMI ≥30 kg/m², mortality rates from all causes, and especially from cardiovascular disease, are generally increased by 50 to 100 percent above that of persons with BMIs in the range of 20 to 25 kg/m².

<table>

</tbody>
</table>

**Notes:**
- Based on reported heights and weights, asked of all respondents.
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 199% of the federal poverty level. “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
- The definition of obesity is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 30.0, regardless of gender.
Weight Control

**About Maintaining a Healthy Weight**

Individuals who are at a healthy weight are less likely to:

- Develop chronic disease risk factors, such as high blood pressure and dyslipidemia.
- Develop chronic diseases, such as type 2 diabetes, heart disease, osteoarthritis, and some cancers.
- Experience complications during pregnancy.
- Die at an earlier age.

All Americans should avoid unhealthy weight gain, and those whose weight is too high may also need to lose weight.

- Healthy People 2020 (www.healthypeople.gov)

**Weight Management.** The following three questions were used to calculate the proportion of adults who are overweight or obese and who are using a combination of both diet and exercise in order to try to lose weight.

“Are you now trying to lose weight?”

“Are you eating either fewer calories or less fat to lose weight?”

“Are you using physical activity or exercise to lose weight?”

---

**Trying to Lose Weight by Both Modifying Diet and Increasing Physical Activity**

(Among Overweight or Obese Respondents)

**HOCC Service Area**

- Yes: 39.1%
- No: 60.9%

**United States**

- Yes: 39.5%
- No: 60.5%

---

- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:

- Reflects respondents who are overweight or obese based on reported heights and weights.
**About Weight Status in Children & Teens**

In children and teens, body mass index (BMI) is used to assess weight status – underweight, healthy weight, overweight, or obese. After BMI is calculated for children and teens, the BMI number is plotted on the CDC BMI-for-age growth charts (for either girls or boys) to obtain a percentile ranking. Percentiles are the most commonly used indicator to assess the size and growth patterns of individual children in the United States. The percentile indicates the relative position of the child’s BMI number among children of the same sex and age.

BMI-for-age weight status categories and the corresponding percentiles are shown below:

- **Underweight** <5th percentile
- **Healthy Weight** ≥5th and <85th percentile
- **Overweight** ≥85th and <95th percentile
- **Obese** ≥95th percentile

The following questions were used to calculate a BMI value (and weight classification as noted above) for each child represented in the survey:

**“How much does this child weigh without shoes?”**

**“About how tall is this child?”**

---

Sources:
1. 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 155]
2. 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents with children age 5-17 at home.
- Overweight among children is determined by children’s Body Mass Index status at or above the 85th percentile of US growth charts by gender and age.
- Obesity among children is determined by children’s Body Mass Index status equal to or above the 95th percentile of US growth charts by gender and age.
Health Advice About Physical Activity & Exercise

“During the past 12 months, has a doctor asked you about or given you advice regarding diet and nutrition?”

“During the past 12 months, has a doctor asked you about or given you advice regarding physical activity or exercise?”

“In the past 12 months, has a doctor, nurse or other health professional given you advice about your weight?”

The chart below details responses to these questions among the total sample of respondents, as well as responses segmented by weight classification based on calculated BMI.

![Chart showing responses to health advice questions by weight classification.](chart-image-url)
Key Informant Input: Nutrition, Physical Activity & Weight

The following chart outlines key informants’ perceptions of the severity of Nutrition, Physical Activity & Weight as a problem in the community:

### Perceptions of Nutrition, Physical Activity, and Weight as a Problem in the Community

**Perceptions of Nutrition, Physical Activity, and Weight as a Problem in the Community**

* (Key Informants, 2015)

- **Major Problem**: 65.9%
- **Moderate Problem**: 20.5%
- **Minor Problem**: 9.1%
- **No Problem At All**: 4.5%

**Sources:** PRC Online Key Informant Survey, Professional Research Consultants, Inc.

**Notes:** Asked of all respondents.

### Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

#### Prevalence of Obesity

* Obesity is widespread in many communities, particularly troubling for children. Local markets often do not have fruits, vegetables and healthy meat options. Obesity is often intergenerational and therefore behavior and habits are difficult to change. – Community/Business Leader*

* Our lifestyles. Take a trip to a mall and observe how many fall into the overweight/obese category. Go to a park and compare the number of people being active to the numbers you see in a mall. Look at what we've taken away from school children, recess, modified PE programs. After-school programs focus on academics, and many communities have “pay to play” sports programs. Marketing dollars spent by soda companies overwhelm any prevention education budgets. – Health Provider (Non-Physician)*

* The rates of overweight and obesity in our community are high. – Social Services Representative*

* Current studies of BMI in elementary school children places approximately 30% of children as obese. – Public Health Expert*

* High obesity and diabetes rates. – Physician*

#### Access to Healthful Foods

* The poor and low class citizens of the community do not have access to and cannot afford the market prices of fresh fruits and vegetables. – Health Provider (Non-Physician)*

* Nutrition is sorely overlooked when attending to patient's chronic needs. Lack of resources available for obese children. Many patients are financially unable to provide balanced meals. – Health Provider (Non-Physician)*

* Access to quality food and a basic knowledge about preparing nutritious food. – Health Provider (Non-Physician)*

* Lack of access to high quality, affordable food due to lack of financial resources and lack of quality food retail. Lack of safe physical activity opportunities for community members. Low health/nutrition education. Lack of long-term exclusive breastfeeding. – Social Services Representative*

Education

Health education regarding proper nutrition and exercise is needed. – Community/Business Leader

Lack of any consistent and connected education. There are programs here and there, but education and information for patients on this is very limited. – Physician

Education on the issues, understanding why people don't put their health care first, usually because of family, work, children issues and time constraints. – Health Provider (Non-Physician)

Early interventions and healthy behaviors should be integrated throughout all aspects of care. Our focus and interventions often exist when disease and complications already exist. Need intense counseling. For those insured, there is limited coverage for these interventions. – Health Provider (Non-Physician)

Nutritional information and access to care and services, particularly for young people. – Community/Business Leader

Practicing consistently on living a healthier life style. – Health Provider (Non-Physician)

It all starts there. – Health Provider (Non-Physician)

Access to Physical Activity

Food insecurity. Lack of access to free or low cost recreation. Lack of open spaces. Lack of education. Cultural barriers to diet modification and lack of access to primary care. – Public Health Expert

Our communities are not built to support integration of physical activity into daily life like walking to school, grocery store. Too much reliance on prepared foods. Overweight and obesity are leading risk factors for many of our chronic diseases. – Health Provider (Non-Physician)

Socioeconomic Challenges

Socio-economic challenges and stressed neighborhoods often make it difficult for residents to engage in healthful physical activity or purchase healthful/fresh foods. Information about healthy eating/healthy cooking is not consistently available. – Community/Business Leader
Substance Abuse

**About Substance Abuse**

Substance abuse has a major impact on individuals, families, and communities. The effects of substance abuse are cumulative, significantly contributing to costly social, physical, mental, and public health problems. These problems include:

- Teenage pregnancy
- Human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS)
- Other sexually transmitted diseases (STDs)
- Domestic violence
- Child abuse
- Motor vehicle crashes
- Physical fights
- Crime
- Homicide
- Suicide

Substance abuse refers to a set of related conditions associated with the consumption of mind- and behavior-altering substances that have negative behavioral and health outcomes. Social attitudes and political and legal responses to the consumption of alcohol and illicit drugs make substance abuse one of the most complex public health issues. In addition to the considerable health implications, substance abuse has been a flash-point in the criminal justice system and a major focal point in discussions about social values: people argue over whether substance abuse is a disease with genetic and biological foundations or a matter of personal choice.

Advances in research have led to the development of evidence-based strategies to effectively address substance abuse. Improvements in brain-imaging technologies and the development of medications that assist in treatment have gradually shifted the research community’s perspective on substance abuse. There is now a deeper understanding of substance abuse as a disorder that develops in adolescence and, for some individuals, will develop into a chronic illness that will require lifelong monitoring and care.

Improved evaluation of community-level prevention has enhanced researchers’ understanding of environmental and social factors that contribute to the initiation and abuse of alcohol and illicit drugs, leading to a more sophisticated understanding of how to implement evidence-based strategies in specific social and cultural settings.

A stronger emphasis on evaluation has expanded evidence-based practices for drug and alcohol treatment. Improvements have focused on the development of better clinical interventions through research and increasing the skills and qualifications of treatment providers.

- Healthy People 2020 (www.healthypeople.gov)

**Related Age-Adjusted Mortality**

**Cirrhosis/Liver Disease.** Heavy alcohol use contributes to a significant share of liver disease, including cirrhosis. The following chart outlines age-adjusted mortality for cirrhosis/liver disease in the area.

**Drug-Induced Deaths.** Drug-induced deaths include all deaths for which drugs are the underlying cause, including those attributable to acute poisoning by drugs (drug overdoses) and deaths from medical conditions resulting from chronic drug use (e.g., drug-induced Cushing's syndrome). A “drug” includes illicit or street drugs (e.g., heroin and cocaine), as well as legal prescription and over-the-counter drugs; alcohol is not included. These deaths may also be either intentional (e.g., suicide) or unintentional (accidental). The following chart outlines local age-adjusted mortality for drug-induced deaths.

- Note the corresponding Healthy People 2020 targets.
**Alcohol Use**

**Current Drinkers.** “Current drinkers” include survey respondents who had at least one drink of alcohol in the month preceding the interview. For the purposes of this study, a “drink” is considered one can or bottle of beer, one glass of wine, one can or bottle of wine cooler, one cocktail, or one shot of liquor.

“*During the past 30 days, on how many days did you have at least one drink of any alcoholic beverage such as beer, wine, a malt beverage, or liquor?*”

**Excessive Drinkers.** Excessive drinking reflects the number of persons aged 18 years and over who drank more than two drinks per day on average (for men) or more than one drink per day on average (for women) or who drank 5 or more drinks during a single occasion (for men) or 4 or more drinks during a single occasion (for women) during the past 30 days.

“*On the day(s) when you drank, about how many drinks did you have on the average?*”

“*Considering all types of alcoholic beverages, how many times during the past 30 days did you have 5 (if male)/4 (if female) or more drinks on an occasion?*”
COMMUNITY HEALTH NEEDS ASSESSMENT

**Notes:**
- Current drinkers had at least one alcoholic drink in the past month.
- Excessive drinking reflects the number of persons aged 18 years and over who drank more than two drinks per day on average (for men) or more than one drink per day on average (for women) OR who drank 5 or more drinks during a single occasion (for men) or 4 or more drinks during a single occasion (for women) during the past 30 days.

- 2013 PRC National Health Survey, Professional Research Consultants, Inc.
Drinking & Driving. As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that the actual incidence of drinking and driving in the community is likely higher.

“During the past 30 days, how many times have you driven when you’ve had perhaps too much to drink?”

Illicit Drug Use

“During the past 30 days, have you used an illegal drug or taken a prescription drug that was not prescribed to you?”
Alcohol & Drug Treatment

“Have you ever sought professional help for an alcohol or drug-related problem?”

Have Ever Sought Professional Help for an Alcohol/Drug-Related Problem

Key Informant Input: Substance Abuse

The following chart outlines key informants’ perceptions of the severity of Substance Abuse as a problem in the community:

Perceptions of Substance Abuse as a Problem in the Community
(Key Informants, 2015)

Barriers to Treatment

Among those rating this issue as a “major problem,” the greatest barriers to accessing substance abuse treatment are viewed as:

Access to Resources
Inability to access mental health resources. Contact with the criminal justice system before having the opportunity to receive help for mental illness. Stigma. – Public Health Expert

Access to detox and in patient care. – Social Services Representative

Health insurance, not knowing where to go, not enough in-patient resources. – Community/Business Leader

There is a high prevalence of substance use in the Hartford community. Many struggle to find holistic treatment that address the underlying struggles often faced by those with addiction. – Community/Business Leader

There are limited resources available. – Health Provider (Non-Physician)

Lack of resources and follow up support. – Community/Business Leader

Not enough providers. – Physician

Not enough treatment beds. – Social Services Representative

Waiting lists, not ready for treatment, etc. – Social Services Representative

Perception of problem with alcohol. Lack of integrated medical and SA services. – Health Provider (Non-Physician)

Stigma

There is both a stigmatism and also a limited availability. Open slots for this care and treatment, especially inpatient and extended patient care. – Physician

Stigma, time, limited social supports, inconsistent messages from provider teams. – Health Provider (Non-Physician)

Denial, stigma. – Health Provider (Non-Physician)

Prevalence of Substance Abuse

High instance of substance abuse. – Health Provider (Non-Physician)

Silent epidemic in the young and old. – Public Health Expert

Increased inappropriate use of prescription drugs. Seems to be an increase in both self-reported and hospital admissions for drug misuse, abuse. More teenagers are experimenting with these relatively easy to acquire drugs and perceive they are safe because they were prescribed to someone as opposed to illegal drugs. – Health Provider (Non-Physician)

Access to Culturally-Appropriate Programs

Lack of culturally relevant and language-appropriate services, social determinants of health/stress. – Social Services Representative

Lack of specific programs for lesbian, gay, bisexual, transgender individuals. – Social Services Representative

Motivation & Support to Get Help

Lack of readiness to give up the habit, the lack of emotional and social support from family and or friends and for some people, the substance abuse environment is all they are accustomed to. – Health Provider (Non-Physician)
Most Problematic Substances

Key informants (who rated this as a “major problem”) were further asked to identify what they view as the most problematic substances abused in the community.

Tobacco Use

About Tobacco Use

Tobacco use is the single most preventable cause of death and disease in the United States. Scientific knowledge about the health effects of tobacco use has increased greatly since the first Surgeon General’s report on tobacco was released in 1964.

Tobacco use causes:
- Cancer
- Heart disease
- Lung diseases (including emphysema, bronchitis, and chronic airway obstruction)
- Premature birth, low birth weight, stillbirth, and infant death

There is no risk-free level of exposure to secondhand smoke. Secondhand smoke causes heart disease and lung cancer in adults and a number of health problems in infants and children, including: severe asthma attacks; respiratory infections; ear infections; and sudden infant death syndrome (SIDS).

Smokeless tobacco causes a number of serious oral health problems, including cancer of the mouth and gums, periodontitis, and tooth loss. Cigar use causes cancer of the larynx, mouth, esophagus, and lung.

Cigarette Smoking

“Do you now smoke cigarettes every day, some days, or not at all?”

- Note the Healthy People 2020 target.

Current Smokers

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 199% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
- Includes regular and occasion smokers (everyday and some days).

Smoking Cessation

About Reducing Tobacco Use

Preventing tobacco use and helping tobacco users quit can improve the health and quality of life for Americans of all ages. People who stop smoking greatly reduce their risk of disease and premature death. Benefits are greater for people who stop at earlier ages, but quitting tobacco use is beneficial at any age.

Many factors influence tobacco use, disease, and mortality. Risk factors include race/ethnicity, age, education, and socioeconomic status. Significant disparities in tobacco use exist geographically; such disparities typically result from differences among states in smoke-free protections, tobacco prices, and program funding for tobacco prevention.

- Healthy People 2020 (www.healthypeople.gov)

“In the past 12 months, has a doctor, nurse or other health professional advised you to quit smoking?”
(Asked of respondents who smoke every day or on some days.)

“During the past 12 months, have you stopped smoking for one day or longer because you were trying to quit smoking?” (Asked of respondents who smoke every day.)
Secondhand Smoke

“In the past 30 days, has anyone, including yourself, smoked cigarettes, cigars or pipes anywhere in your home on an average of four or more days per week?”

The following chart details these responses among the total sample of respondents, as well as among only non-smokers and only households with children age 0-17.

Member of Household Smokes At Home
(HOCC Service Area, 2015)
Other Tobacco Use

“Do you currently use chewing tobacco, snuff, or snus every day, some days, or not at all?”

“Do you now smoke cigars every day, some days, or not at all?”

Key Informant Input: Tobacco Use

The following chart outlines key informants’ perceptions of the severity of Tobacco Use as a problem in the community:
Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

At-Risk Populations

- Tobacco use among Latinos and Blacks in CT is higher than among whites and higher than the state's average. Tobacco use is a major factor in development of chronic diseases. – Social Services Representative
- Tobacco use has been a part of the lesbian, gay, bisexual culture for decades. Step outside a gay bar to find many smokers. – Social Services Representative
- Cigarettes are the poor man's treatment for mental illness. Lack of education. Food insecurity, cigarettes help hunger pangs. – Public Health Expert
- Tobacco use is widespread in some communities particularly amongst individuals with current or prior substance abuse challenges. Tobacco has become very expensive, yet many with limited income still smoke. – Community/Business Leader
- Young smokers. – Health Provider (Non-Physician)
- Smoking continues to pose a significant health risk to our students. – Community/Business Leader
- High smoking in lower-income adults. – Physician

Addiction

- Addiction. – Health Provider (Non-Physician)
- Tobacco addiction and its impact on lung health. – Health Provider (Non-Physician)

Prevalence of Smoking

- Perceived high use rate. – Health Provider (Non-Physician)

Lack of Smoking Cessation Programs

- There are very few smoking cessation programs that are paid for by Husky or commercial insurers and group programs are almost never covered under insurance but often the most effective. – Physician
### Access to Health Services

**Lack of Health Insurance Coverage (Age 18 to 64)**

Survey respondents were asked a series of questions to determine their healthcare insurance coverage, if any, from either private or government-sponsored sources. Here, lack of health insurance coverage reflects respondents **age 18 to 64** (thus excluding the Medicare population) who have **no** type of insurance coverage for healthcare services – neither private insurance nor government-sponsored plans (e.g., Medicaid).

**“Do you have any government-assisted healthcare coverage, such as Medicare, Medicaid (or another state-sponsored program), or VA/military benefits?”**

**“Do you currently have: health insurance you get through your own or someone else’s employer or union; health insurance you purchase yourself; or, you do not have health insurance and pay for health care entirely on your own?”**

---

**Lack of Healthcare Insurance Coverage**

(Among Adults Age 18-64)

Healthy People 2020 Target = 0.0% (Universal Coverage)

Difficulties Accessing Healthcare

About Access to Healthcare

Access to comprehensive, quality health care services is important for the achievement of health equity and for increasing the quality of a healthy life for everyone. It impacts: overall physical, social, and mental health status; prevention of disease and disability; detection and treatment of health conditions; quality of life; preventable death; and life expectancy.

Access to health services means the timely use of personal health services to achieve the best health outcomes. It requires three distinct steps: 1) Gaining entry into the health care system; 2) Accessing a health care location where needed services are provided; and 3) Finding a health care provider with whom the patient can communicate and trust.

Barriers to Healthcare Access

To better understand healthcare access barriers, survey participants were asked whether any of the following barriers to access prevented them from seeing a physician or obtaining a needed prescription in the past year.

“Was there a time in the past 12 months when…

- ... you needed medical care, but had difficulty finding a doctor?”
- ... you had difficulty getting an appointment to see a doctor?”
- ... you needed to see a doctor, but could not because of the cost?”
- ... a lack of transportation made it difficult or prevented you from seeing a doctor or making a medical appointment?”
- ... you were not able to see a doctor because the office hours were not convenient?”
- ... you needed a prescription medicine, but did not get it because you could not afford it?”

The percentages shown in the following chart reflect the total population, regardless of whether medical care was needed or sought.
The following chart reflects the composite percentage of the total population experiencing problems accessing healthcare in the past year (indicating one or more of the aforementioned barriers or any other problem not specifically asked), again regardless of whether they needed or sought care.

**Experienced Difficulties or Delays of Some Kind in Receiving Needed Healthcare in the Past Year**
(HOCC Service Area, 2015)

Sources:
- 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 189]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents; represents the percentage of respondents experiencing one or more barriers to accessing healthcare in the past 12 months.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 199% of the federal poverty level. “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Accessing Healthcare for Children

Surveyed parents were also asked if, within the past year, they experienced any trouble receiving medical care for a randomly-selected child in their household.

"Was there a time in the past 12 months when you needed medical care for this child, but could not get it?"

**Had Trouble Obtaining Medical Care for Child in the Past Year**
(Among Parents of Children 0-17)

Parents with trouble obtaining medical care for their child mainly reported barriers due to cost or lack of insurance coverage. Specific health issues were also mentioned.

Key Informant Input: Access to Healthcare Services

The following chart outlines key informants’ perceptions of the severity of Access to Healthcare Services as a problem in the community:

Notes: Asked of all respondents.
**Top Concerns**

Among those rating this issue as a “major problem,” reasons frequently related to the following:

**Shortage of Physicians**

Because of consolidation and because of the high expense associated with medical practice in Connecticut, there are simply some services that are limited due to the limited number of physicians in clinical practice. Further, while the focus has been on increasing health insurance coverage, the state of Connecticut has done very little to focus on the access issue or further supporting the care delivery infrastructure necessary as more and more consumers have coverage, causing coverage to be confused with access. – Physician

Cost and the shortage of primary care physicians. – Health Provider (Non-Physician)

Insurance and not enough doctors available. – Social Services Representative

Inadequate access to subspecialty care. – Physician

Accessing primary health care, behavioral health and patient navigation within the same facility. – Health Provider (Non-Physician)

**Insurance & Cost of Services**

There are several challenges related to accessing health care service including affordability. Sometime the basic health care package doesn’t cover all the services. Need education. Sometimes the community are not aware of services that are being provided. Accessibility. Service provided in the community are not at the standard care and to get that quality of service may take a person to travel beyond the community to get that care. – Social Services Representative

The affordability of health insurance. – Social Services Representative

There are a number of individuals that do not have health insurance. Also many residents don’t attend regular preventive care appointments and many large community health centers are not accepting new patients for routine care. Transportation is a barrier as well as changing the way people think of about health. – Community/Business Leader

Medication costs and access. – Health Provider (Non-Physician)

**Transportation**

For some, the ability to have adequate transportation is one major factor. In addition, since I work with primarily mono lingual clients, it is difficult when there are no adequate personnel trained to serve as medical interpreters for these clients at medical office, FQHC’s, etc. In the Hartford area, to my knowledge there is only one FQHC on the North end of Hartford, to some clients living in other areas, it is difficult to get there and moreover, whether they will have someone to provide understandable translation services. – Social Services Representative

Transportation and compliance. – Social Services Representative

**Stigma**

Stigma, lack of resources, lack of education. – Health Provider (Non-Physician)

Stigma around and discrimination towards lesbian, gay, bisexual and transgender individuals and people living with HIV/AIDS. Lack of understanding and education on the part of health care providers. In some cases, barriers related to health insurance coverage, particularly for transgender individuals. – Social Services Representative
Knowledge About Services

Lack of knowledge about services. Lack of coordination of care or rather, inability to access coordinated care. – Public Health Expert

Ongoing Disease Management

Adherence to medications and clear medication regimes to minimize Polypharmacy. Inconsistencies with patient partnerships to establish clear goals of care with providers, patients and families. – Health Provider (Non-Physician)

Type of Care Most Difficult to Access

Key informants (who rated this as a “major problem”) were further asked to identify they type of care they perceive as the most difficult to access in the community.

Primary Care Services

About Primary Care

Improving health care services depends in part on ensuring that people have a usual and ongoing source of care. People with a usual source of care have better health outcomes and fewer disparities and costs. Having a primary care provider (PCP) as the usual source of care is especially important. PCPs can develop meaningful and sustained relationships with patients and provide integrated services while practicing in the context of family and community. Having a usual PCP is associated with:

- Greater patient trust in the provider
- Good patient-provider communication
- Increased likelihood that patients will receive appropriate care

Improving health care services includes increasing access to and use of evidence-based preventive services. Clinical preventive services are services that: prevent illness by detecting early warning signs or symptoms before they develop into a disease (primary prevention); or detect a disease at an earlier, and often more treatable, stage (secondary prevention).

Access to Primary Care

This indicator is relevant because a shortage of health professionals contributes to access and health status issues.

Access to Primary Care

(Number of Primary Care Physicians per 100,000 Population, 2012)

Sources: US Department of Health & Human Services, Health Resources and Services Administration, Area Health Resource File: 2012.

Notes: This indicator is relevant because a shortage of health professionals contributes to access and health status issues.
Specific Source of Ongoing Care

Having a specific source of ongoing care includes having a doctor’s office, clinic, urgent care center, walk-in clinic, health center facility, hospital outpatient clinic, HMO or prepaid group, military/VA clinic, or some other kind of place to go if one is sick or needs advice about his or her health. This resource is crucial to the concept of “patient-centered medical homes” (PCMH).

“Is there a particular place that you usually go to if you are sick or need advice about your health?”

“What kind of place is it: a medical clinic, an urgent care center/walk-in clinic, a doctor’s office, a hospital emergency room, military or other VA healthcare, or some other place?”

The following chart illustrates the proportion of the Hospital of Central Connecticut Service Area population with a specific source of ongoing medical care. Note that a hospital emergency room is not considered a specific source of ongoing care in this instance.

- Note the Healthy People 2020 objectives.

Have a Specific Source of Ongoing Medical Care
(HOCC Service Area, 2015)
Healthy People 2020 Target = 95.0% or Higher [All Ages]; ≥89.4% [18-64]; 100% [65+]

Sources:
- 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 166-168]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 199% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Utilization of Primary Care Services

Adults: “A routine checkup is a general physical exam, not an exam for a specific injury, illness or condition. About how long has it been since you last visited a doctor for a routine checkup?”

Children: “About how long has it been since this child visited a doctor for a routine checkup or general physical exam, not counting visits for a specific injury, illness, or condition?”

Have Visited a Physician for a Routine Checkup in the Past Year

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Items 17, 113]

Notes: Asked of all respondents.

Adults: Have Visited a Physician for a Checkup in the Past Year (HOCC Service Area, 2015)

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 17]

Notes: Asked of all respondents. Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents). Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 199% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Emergency Room Utilization

“In the past 12 months, how many times have you gone to a hospital emergency room about your own health? This includes ER visits that resulted in a hospital admission.” (Responses below reflect the percentage with two or more visits in the past year.)

“What is the main reason you used the emergency room instead of going to a doctor’s office or clinic?”

Have Used a Hospital Emergency Room More Than Once in the Past Year

Oral Health

About Oral Health

Oral health is essential to overall health. Good oral health improves a person’s ability to speak, smile, smell, taste, touch, chew, swallow, and make facial expressions to show feelings and emotions. However, oral diseases, from cavities to oral cancer, cause pain and disability for many Americans. Good self-care, such as brushing with fluoride toothpaste, daily flossing, and professional treatment, is key to good oral health. Health behaviors that can lead to poor oral health include: tobacco use; excessive alcohol use; and poor dietary choices.

The significant improvement in the oral health of Americans over the past 50 years is a public health success story. Most of the gains are a result of effective prevention and treatment efforts. One major success is community water fluoridation, which now benefits about 7 out of 10 Americans who get water through public water systems. However, some Americans do not have access to preventive programs. People who have the least access to preventive services and dental treatment have greater rates of oral diseases. A person’s ability to access oral healthcare is associated with factors such as education level, income, race, and ethnicity.

Barriers that can limit a person’s use of preventive interventions and treatments include: limited access to and availability of dental services; lack of awareness of the need for care; cost; and fear of dental procedures.

There are also social determinants that affect oral health. In general, people with lower levels of education and income, and people from specific racial/ethnic groups, have higher rates of disease. People with disabilities and other health conditions, like diabetes, are more likely to have poor oral health.

Potential strategies to address these issues include:

- Implementing and evaluating activities that have an impact on health behavior.
- Promoting interventions to reduce tooth decay, such as dental sealants and fluoride use.
- Evaluating and improving methods of monitoring oral diseases and conditions.
- Increasing the capacity of State dental health programs to provide preventive oral health services.
- Increasing the number of community health centers with an oral health component.

Dental Care

Adults: “About how long has it been since you last visited a dentist or a dental clinic for any reason?”

Children Age 2-17: “About how long has it been since this child visited a dentist or dental clinic?”

- Note the Healthy People 2020 target.
Have Visited a Dentist or Dental Clinic Within the Past Year
Healthy People 2020 Target = 49% or Higher (Adults & Children)

Notes:  
- Asked of all respondents.
Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Prevalence

- High [dental] caries and unmet care needs. – Physician
- Evidence by the large number of people who access periodic free dental clinics. – Community/Business Leader

Cost & Access to Care

- Financial constraints and the cost of providing Dental services. – Health Provider (Non-Physician)
- Although Husky enrolled patients have access to dental care, booking appointments can be challenging, especially for emergency dental needs. Patients are going to the Emergency Room rather than receiving preventive Oral Health care. An FQHC is located in town, and they are expanding their dental operatory. However, we have received complaints of long wait times to get an appointment to receive emergency dental care. – Public Health Expert
- Not covered by some insurances. – Health Provider (Non-Physician)
- Consistent access to high quality dental care is not always achievable for low-income Hartford families. Dental issues are a significant cause of school absences. – Community/Business Leader
- While access to services has improved after the Medicaid rate increase, rural areas continue to lag behind. – Health Provider (Non-Physician)
- Not having access to dental will cause other medical problems. – Health Provider (Non-Physician)
- Limited education and access to education for many people. Access to care another contributing factor. – Health Provider (Non-Physician)

Discrimination for People With HIV/AIDS

- For people living with HIV/AIDS in particular, there is still discrimination and misunderstanding on the part of oral health professionals. – Social Services Representative
Vision Care

“When was the last time you had an eye exam in which the pupils were dilated? This would have made you temporarily sensitive to bright light.” (Responses in the following chart represent those with an eye exam within the past 2 years.)

See also Vision & Hearing in the Death, Disease & Chronic Conditions section of this report.
Local Resources

Perceptions of Local Healthcare Services

“How would you rate the overall health care services available to you? Would you say: excellent, very good, good, fair or poor?” (Combined “fair/poor” responses are outlined in the following chart.)

Perceive Local Healthcare Services as “Fair/Poor”
